## CIRCUIT DESCRIPTION

### Frequency Configuration

The TM-721A/E uses a synthesized PLL and includes a variable-frequency oscillator that enables selection of 5 kHz, 10 kHz, 12.5 kHz, 20 kHz, or 25 kHz channel steps. (See Fig. 1.)

Signals received in the 144 MHz band are down-converted to a first intermediate frequency of 10.7 MHz (M.T.W) and 16.9 MHz (K) by mixing with the first local oscillator frequency (133.3 MHz to 135.3 MHz (T.W), 172.1 MHz to 131.100 MHz (K), 131.1 MHz to 137.30 MHz (M)), and then to the second intermediate frequency of 455 kHz by mixing with the second local oscillator frequency of 10.245 MHz (M.T.W) and 17.355 MHz (K).

Signals received in the 430 MHz band are down-converted to the first intermediate frequency of 30.825 MHz (M.T.W) and 21.6 MHz (K) by mixing with the first local oscillator frequency (399.175 MHz to 409.175 MHz (M.T.W), 416.400 MHz to 428.400 MHz (K)), and then to the second intermediate frequency of 455 kHz by mixing with the second local oscillator frequency of 30.37 MHz (M.T.W) and 21.145 MHz (K). Double conversion is thus used for both the 144 MHz and 430 MHz bands.

The transmitted signal for both bands is generated direct oscillation and direct frequency division in the phaselocked loop. The signal is amplified by a linear amplifier before being applied for the antenna.

## CIRCUIT DESCRIPTION

### Receiver Circuits

#### • General

This set uses separate receiver circuits for the 144 MHz and 430 MHz bands. These circuits extend from the antenna input section to the IF detector.

#### • 144 MHz

The incoming two meter band signal passes thru the transmit/receive switching diode in the final unit. And then through the antenna matching coil in the front unit. It is then amplified by a GaAs FET radio-frequency amplifier, filtered by a three-stage bandpass filter that uses varicap tuning to reject unwanted signal components, and is fed to the first mixer. There it is mixed with the first local oscillator signal from the PLL to generate the first IF signal (10.7 MHz (M.T.W), 16.9 MHz (K)). Spurious adjacent-channel signals are removed in a two-stage MCF (Monolithic Crystal Filter).

The first IF signal is amplified and fed to the FM IF IC:MC3361D. This IF signal is mixed with the second local oscillator frequency of 10.245 MHz (M.T.W) and 17.355 MHz (K) which results in a second IF signal of 455 kHz.

Spurious adjacent-channel signals are removed from the second IF signal by ceramic filter. Then the signal is amplified and detected to generate the audio signal.

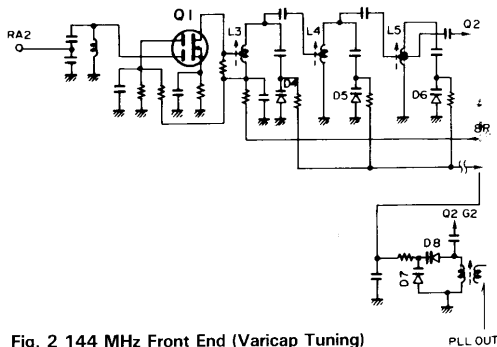

Fig. 2 144 MHz Front End (Varicap Tuning)

#### • 430 MHz band

The incoming 70 cm signal passes thru the transmit/receive antenna switching diodes in the final unit and then passes through the antenna matching coil. The signal is then fed to a two-stage radio-frequency amplifier consisting of a GaAs FET and a junction-type FET. It then passes through a two-stage two-cavity helical resonator and enters the first mixer, where it is mixed with the first local oscillator signal from the PLL to generate the first IF signal (30.825 MHz (M.T.W), 21.6 MHz (K)). Spurious adjacent-channel signals are removed by a two-stage MCF.

The first IF signal is amplified and fed to the FM IF IC (MC3361D). This IF signal is mixed with a second local oscillator frequency of 30.37 MHz (M.T.W) and

21.145 MHz (K) which converts it to a second IF signal of 455 kHz.

Spurious adjacent-channel signals are removed from the second IF signal by a ceramic filter. The signal is then amplified and detected to generate the audio signal.

### • AF Unit

The path from the detector output to the AF power amplifier input consists of two separate identical circuits for the main band and the subband. The audio signal is first switched by an analog switch into the AF preamplifier for its corresponding band. After amplification, the signal level is adjusted by a two-channel electronic volume control IC: M51523 which is controlled by the MAIN VOLUME and BALANCE controls on the front panel. An AF low-pass filter then removes unwanted high-frequency components. Next the two audio signals are combined to create a single audio signal which is amplified by the audio power amplifier before being applied to the speaker. (See Fig. 3.)

**Fig. 3 AF Section**

### • Squelch Circuits

Independent squelch circuits are provided for the main band and subband. These circuits receive the output from the detector, remove the 50 kHz noise component, amplify the signal with two transistor stages, and rectify it by means of a diode to generate the squelch control signal. After DC amplification, the control signal is used to switch the main and sub preamplifiers on and off.

### • S Meter Circuits

Independent S meter circuits for the 144 MHz and 430 MHz bands receive signals from the 455 kHz ceramic filter, amplify it in two-stage meter amplifier, and rectify the resulting signal to generate a DC voltage. The microprocessor converts the analog DC voltage to a digital output that is used to drive an LCD bar meter.

**Fig. 4 144 MHz S-meter circuit**

### • Switching of Balance Range

To disable the BALANCE control in the single mode, the control voltage range of the BALANCE control is switched. This switching is done by a Low signal from the INH (Inhibit) pin of the microprocessor that turns on transistor Q7 in the single mode. Since the center voltage of the balance control resistor is held to approximately 4 V, the voltage at the BAL pin cannot exceed 4 V, so even if the balance VR is moved to the SUB position, the main band remains unattenuated. (See Fig. 5 and 6.)

**Fig. 5**

**Fig. 6**

During normal operation, the two electronic volume controllers in the set operate using the M51523AL, but when the remote control unit (RC-10) is connected and used to adjust the output level, they are controlled by the LC7532M.

When the remote control unit is connected, a High switch control signal is sent from the CE pin of shift register IC4 to force the attenuation of the M51523AL to zero. (Normally the CE output is Low.) The UP and DOWN signals from the shift register then vary the attenuation of the LC7532M. (See Fig. 7.)

### • Muting Circuit

There are three types of audio muting:

MU1 : Mutes the main band momentarily during memory scan etc. And during transmission.

MU2 : Mutes the subband when the CTCSS key is pressed.

MU3 : Operates when the MUTE key is pressed on the front panel.

## CIRCUIT DESCRIPTION

### Transmitter Circuits

#### • General

Except for the microphone amplifier and APC (Automatic Power Control) circuits, the transmitting circuits are independent.

#### • Modulation Circuit

The audio signal from the microphone is fed to three operational amplifiers which perform preemphasis, amplification, and limiting, and form a splatter filter that removes unwanted high-frequency components.

The modulation circuit directly modulates the VCO (Voltage control oscillator) for the 144 MHz and 430 MHz bands by using a varicap. (See Fig. 9.)

Fig. 9 Modulation Circuit

#### • Preamplifier Stage Circuit

A three-stage linear amplifier is used in both the 144 MHz and 430 MHz bands. Due to its wideband design, this linear amplifier provides stable drive output without adjustment.

#### • Power Amplifier Circuit

The drive signal is fed to the power modules and amplified to the required levels. It then passes through the TX/RX switching diode and a filter and is transmitted via the antenna.

Table 7 Maximum Ratings of Power Modules

#### • APC and SWR (Standing Wave Ratio) Protection Circuits

The APC (automatic transmit output control) circuit and protection circuit have independent detectors in both bands. The control circuit is a common hybrid IC.

The APC detects the output from the power module and feeds the result to the hybrid IC. The SWR protection circuit extracts a portion of the reflected wave generated by antenna mismatch-

ing at the CM (Capacitance Matching) coupler, detects it, and feeds the result to the hybrid IC.

The hybrid IC controls the power transistor Q5 : 2SD1406 (Y) in the drive stage, controls the drive transistor and the second pin of the power module, and thus varies the transmitter output.

### PLL Synthesizer

**Fig. 12** is a block diagram of the PLL and VCO sections of the 144 MHz and 430 MHz circuits. A feature of the PLL system in the TM-721A/E is that there are independent subunits for the 144 MHz and 430 MHz bands, each consisting of an upper VCO section and a lower PLL section. Both sections are enclosed in a sturdy case that shields them from external signals.

To provide 5 kHz, 10 kHz, 12.5 kHz, 20 kHz, and 25 kHz steps, the 12.8 MHz frequency of the reference oscillator in both the 144 MHz and 430 MHz bands is divided by 2048 and 2056 according to the step count to yield frequencies of 6.25 kHz and 5 kHz. Each VCO oscillates directly at the target frequency. After single-stage amplification, the frequency is applied to a pulse-swallow PLL IC which divides it, performs phase comparison, and locks the frequency.

The PLL system for the 144 MHz band locks without switching between TX and RX. The lock-up time of the PLL is shortened by using pin 10 of the PLL IC (M54959FP), which is Low in TX, to turn off the low-pass filter Q1 and Q2 in Fig. 13, only at the instant when the set is switched to TX, thus shortening. The time it takes the transmitter to lock.

The PLL system for the 430 MHz band locks on a single VCO, with band switching for TX and RX performed inside the VCO.

### • 8T2 (Transmit 8V) and Unlock Circuit

During receive, 0.7 V desional is applied to the base of Q8 which turns Q8 on, Q7 off, and Q10 off, so no voltage is output at the collector (8T2) (TX +8 V) of Q10.

When the PTT (Push-to Talk) switch is depressed, serial data is sent from the microprocessor to IC1 (the phase-locked loop) causing pin 10 of IC1 to go Low. This switches Q8 off, Q7 on, and Q10 on, so that 8 V is applied to 8T2. (In transmission, 8 V is applied to 8T2 from 8C.)

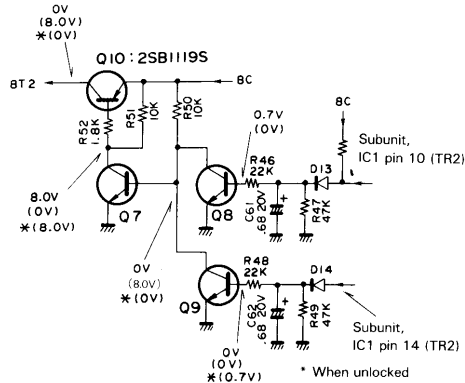

Fig. 11 8T2 (Transmit 8 V) and Transmit Unlock Circuits

## CIRCUIT DESCRIPTION

Fig. 12 PLL and VCO Block Diagram

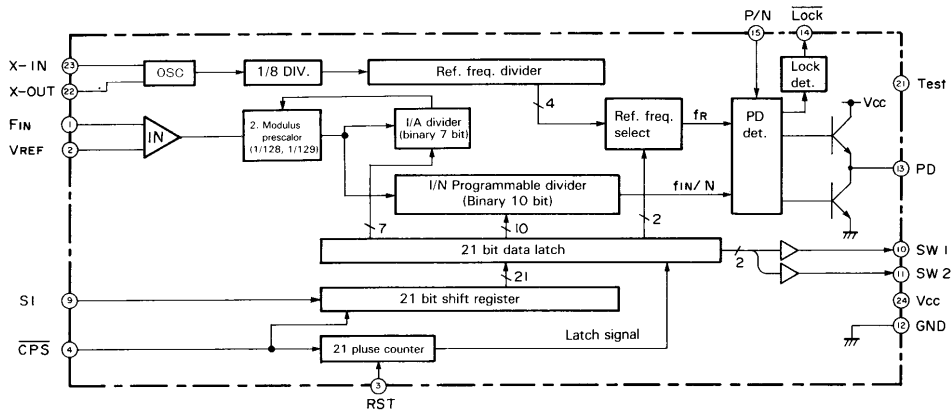

Fig. 13 M54959 Pulse Swallow Control Circuit

## CIRCUIT DESCRIPTION

The unlock circuit operates only in the transmitter circuit. A description of the 430 MHz unlock circuit follows. Q9 is the PLL unlock switching transistor. Normally the base of Q9 is Low (0 V) and the collector of Q9 is High (8 V). When the PLL unlocks 0.7 V dc is applied to the base of Q9, Turning Q9 on forcing the collector to 0 V (Low). This switches Q7 off. When the PLL unlocks (during transmission), the collector of Q7 goes to 8 V (instead of the normal 0 V) and Q10 turns off. Therefore the 8T switching transistor Q10 turns off and the transmit bias voltage goes dead. This prevents transmitter output when the PLL is unlocked.

### • 8R (Receive 8 V) Stop Circuit

In receiving, the base of Q12 receives a 5 V dc signal that turns Q12 on (so the collector of Q12 goes to 0 V). Q11 then turns on and provides 8 V at its collector. (In receiving, 8 V is supplied from 8C (Common +8 V) to 8R.)

During transmit, serial data from the microprocessor is passed thru shift register IC4. The output from IC4 at pin 11 goes Low. Q12 therefore turns off (its collector voltage going to 8 V), Q11 turns off, and no 8R output is provided from the collector of Q11.

The PLL IC (M54959FP) can be controlled for its two reference division ratios and single comparison division ratio. The pulse-swallow PLL circuit is contained on a single chip and consists of a built-in dual-modulus (1/128 and 1/129) prescaler.

The switch function (pin 10) of the PLL IC controls the 8T1 (TX +8 V (430 MHz)) and 8T2 (TX +8 V (144 MHz)) lines.

In the 144 MHz band, the relation ship between  $F_{VCO1}$  and the division ratios is:

$$F_{VCO1} = (144 - 10.7) = \{(n1 \times 128) + A1\} \times F_{osc} + R$$

$F_{VCO1}$  : Output frequency of 144 MHz-band VCO  
 $n1$  : Value to which binary 10-bit programmable counter is set  
 $A1$  : Value to which binary 7-bit programmable counter is set  
 $F_{osc}$  : Reference oscillator frequency, 12.8 MHz  
 $R$  : Value to which binary 14-bit programmable counter is set  
 $R = 2560$  for 5 kHz, 10 kHz, 20 kHz, and 25 kHz steps  
 $R = 2048$  for 12.5 kHz steps  
 If  $n1 = 208$ ,  $A1 = 36$ , then with 5 kHz, 10 kHz, 20 kHz, or 25 kHz steps:  
 $\therefore F_{VCO1} = \{(208 \times 128) + 36\} \times 12800 + 2560$   
 $= (26624 + 36) \times 5$   
 $= 133300 = 133.3 \text{ MHz}$

In the 430 MHz band the relation between  $F_{VCO2}$  (RX) and the division ratios is:

$$F_{VCO2} = (430 - 30.825) = \{(n2 \times 128) + A2\} \times F_{osc} + R$$

$F_{VCO2}$ : Output frequency of 430 MHz-band VCO  
 $R$  and  $F_{osc}$ : Same step frequencies as in the 144 MHz band  
 In this case  $n2 = 623$  and  $A2 = 91$ , so:  
 $\therefore F_{VCO2} = \{(623 \times 128) + 91\} \times 12800 + 2560$   
 $= (79744 + 91) \times 5$   
 $= 399175 = 399.175 \text{ MHz}$

### • Key and Rotary Encoder Input Circuit

Fig. 16 shows the key and rotary encoder input circuit. The keys on the front panel form a matrix which the microprocessor reads by scanning. Signals from the two rotary encoders (MAIN and SUB), the microswitches (PTT, UP, DOWN) and the F.LOCK switch are applied to the CPU directly.

Fig. 16 Key, Switch, and Rotary Encoder Input Circuit

## CIRCUIT DESCRIPTION

### • Reset and Backup Circuits

Fig. 17 shows the reset and backup circuits.

When power is switched on, the reset circuit applies a Low pulse with a duration of approximately 3 mS to the RESET input of the microprocessor. This causes a power-on reset. When power is switched off, the backup circuit detects the voltage drop on the 8 V line and applies a High signal to the INT4 input of the microprocessor. This places the microprocessor in the backup state.

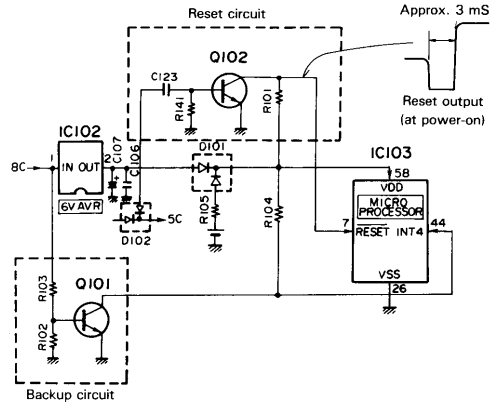

Fig. 17 Reset and Backup Circuits

### • Display Circuit

Located on the LCD assembly, the display circuit consists of two LCD drivers, one for the main band and one for the sub-band, together with their supporting circuits and the liquid crystal display. (See Fig. 18.) The LCD is driven dynamically with a 50% duty cycle. The data to be displayed is sent as

serial data to the LCD from pins P30 to P33 of the microprocessor.

In single operation, the microprocessor sends the subband LCD driver an inhibit signal to suppress the subband display.

### 144 MHz Band

The 21 data bits are obtained as follows:

#### 1. Division data A and N (17 bits)

F (displayed value – 10.7 MHz in RX)

$$= \{(N \times 128) + A\} \times 12.8 \text{ MHz} \div \text{ref}$$

N: 10-bit binary value; division ratio of main counter

A: 7-bit binary value; division ratio of swallow counter

#### 2. Reference frequency (ref) selection (2 bits)

Data		Phase reference frequency	
D1	D2		
L	L	5 kHz	With 5 kHz, 10 kHz, 20 kHz, or 25 kHz steps
H	L	6.25 kHz	With 12.5 kHz steps

#### 3. Switch selection (2 bits)

H	H	H	H	At RX With ACC OFF
L	H	L	H	At TX With ACC OFF
H	L	H	L	At RX With ACC ON
L	H	L	H	At TX With ACC ON

### 430 MHz Band

The 21 data bits are derived as follows:

#### 1. Division data A and N (17 bits)

F (displayed value – 30.825 MHz in RX)

$$= \{(N \times 128) + A\} \times 12.8 \text{ MHz} \div \text{ref}$$

N: 10-bit binary value; division ratio of main counter

A: 7-bit binary value; division ratio of swallow counter

#### 2. Reference frequency (ref) selection (2 bits)

Data		Phase reference frequency	
D1	D2		
L	L	5 kHz	With 5 kHz, 10 kHz, 20 kHz, or 25 kHz steps
H	L	6.25 kHz	With 12.5 kHz steps

## CIRCUIT DESCRIPTION

### • Shift Register Circuit

By shifting serial data from the microprocessors, the two shift registers (IC3 and IC4) perform the following control functions:

- Main and sub standby control
- Muting control
- Low power control
- Electronic volume control, UP/DOWN switching
- Dimmer control
- Main/sub select
- Squelch off control

### • Dimmer Control Circuit

**Fig. 21** shows the AVR circuit in the LB. The LB (Lamp + B) voltage is lowered by switching the reference voltage zener diodes.

Normally the base voltage of Q2 is held to approximately 11 V by the 11 V zener diode D1:02CZ11Y, and the pilot lamp voltage LB is approximately 10.5 V. When the DIM switch is set to the ON position, 5 V dc is obtained from pin 4 of shift register IC3, causing Q3 DCT 114EK to go from High to Low, thereby connecting zener diode D2:02Z82Y in parallel to D1.

Therefore, the base voltage of Q2 is held to the zener voltage (8.2 V) of D2, resulting in a drop to approximately 8.5 V. The pilot lamp voltage LB then drops to approximately 7.8 V and the pilot lamp dims.

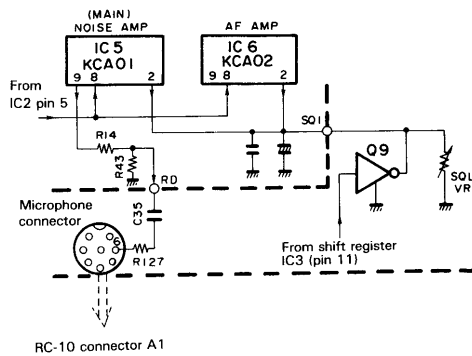

**Fig. 21 LB (Lamp + B) AVR Circuit**

### • Squelch-Off Circuit (When RC-10 is Connected)

**Fig. 22** shows the squelch-off circuit. This circuit opens the squelch gate for the main band from the remote controller when the remote control unit is used.

When the RC-10 is connected, it communicates with the microprocessor in the set via pins 2, 3, and 4 of the microphone connector. When the RC-10 is connected, the exchange of data with the microprocessor causes pin 11 of shift register IC3 to provide a High switch control signal, so transistor Q9 goes Low and the SQL pin is dropped to ground level.

The result is that the squelch VR for the main band is left open. Part of the main noise amplifier output is fed from the RD (Remote Data) pin to pin 6 of the microphone connector, and from there to the RC-10.

**Fig. 22 Squelch Off Circuit**

### • Beep Tone

The microprocessor generates a beep tone of approximately 1.2 kHz at pin P20. This signal is reshaped into a rectangular wave by an C, R wave-shaping circuit.

**Fig. 23**

## CIRCUIT DESCRIPTION

### • Tone Output

Signals from pins P40 to P43 and P50 to P53 of the microprocessor are fed to a ladder resistor network (IC104) which performs D-A conversion and provides 38 signals ranging from 67.0 to 250.3.

Fig. 24 shows the internal structure of IC104.

Fig. 24 Ladder Network: Internal Structure of KRR-C001 (Control Unit IC104)

### • Input and Output for Remote Control Unit (RC-10, Option)

When the remote control unit is connected, the microprocessor receives a High input at P123 and switches the following pin functions:

P03 →SI : Serial data input pin

P02 →SO : Serial data output pin

P01 →SCK : Serial clock input/output pin

Data transfer between the microprocessor in the set and the microprocessor in the remote control unit takes place over these lines.

### • S meter and RF meter input

The S meter and RF meter voltages are coupled separately for the main band and subband and are provided as the M1 and M2 inputs to the PTH00 and PTH01 pins of the microprocessor.

The input voltage is converted internally to a 4-bit digital value (16 levels) and sent to the display.

### • Busy Input

BUSY signals are supplied separately to the microprocessor for the main band and subband. If squelch is on, the microprocessor receives a Low input when the received signal is present, and lights the BUSY indicator.

### • Input and Output for CTCSS Unit (Option)

The microprocessor provides data for the CTCSS unit from pins P70, P71, and P73. This data specifies the CTCSS tone frequency and CTCSS unit on/off information.

When a tone is detected from the CTCSS unit, the microprocessor receives a High input at P121 and opens the squelch gate.

## PACKING

## ADJUSTMENT

### REQUIRED TEST EQUIPMENT

1. **DC V.M**
  - 1) High input impedance
2. **RF VTVM (RF V.M)**
  - 1) Input impedance : 1 M $\Omega$  min., 2 pF max.
  - 2) Voltage range : F.S= 10 mV ~ 300 V
3. **Frequency Counter (f. counter)**
  - 1) Input sensitivity : Approx. 50 mV
  - 2) Frequency range : Up to 450 MHz
4. **DC Power Supply**
  - 1) Voltage : 10 V ~ 17 V, variable
  - 2) Current : 15 A min.
5. **Power Meter**
  - 1) Measurement range Approx. : 50 W, 3 W, 1 W
  - 2) Input impedance : 50  $\Omega$
  - 3) Frequency range : 450 MHz
6. **AF VTVM (AF V.M)**
  - 1) Input impedance : 1 M $\Omega$  min.
  - 2) Voltage range : F.S= 1 mV ~ 30 V
  - 3) Frequency range : 50 Hz ~ 10 kHz
7. **AF Generator (AG)**
  - 1) Output frequency : 100 Hz ~ 10 kHz
  - 2) Output voltage : 0.5 mV ~ 1 V
8. **Linear Detector**
  - 1) Frequency range : 450 MHz
9. **Field Strength Meter**
  - 1) Frequency range : 450 MHz
10. **Directional Coupler**
11. **Oscilloscope**
  - 1) High sensitivity oscilloscope with horizontal input terminal
12. **SSG**
  - 1) Frequency range : 144 MHz and 430 MHz bands
  - 2) Modulation : AM and FM MOD.
  - 3) Output level : -20 dB to 100 dB
13. **Dummy Load**
  - 1) 8  $\Omega$ , 50 W (approx.)
14. **Noise Generator**
  - 1) Must generate ignition-like noise containing harmonics beyond 450 MHz.

### 15. Sweep Generator

- 1) Sweep range : 1440 MHz and 430 MHz bands

### 16. Tracking Generator

### PREPARATION

- 1) Unless otherwise specified, knobs and switches should be set as follows **Table 7**.

POWER SW	ON	SUB SQ VR	OFF
AF VOL VR	MIN	SCAN/L. OUT	OFF
MAIN SQ VR	MIN	SHIFT/AL	OFF
LOW SW	HI	TONE/T. SEL	OFF

F. LOCK SW	OFF	A, B, C	OFF
BALANCE VR	MAIN	DUAL SW	OFF
		BAND ACC	OFF

Table 7

Fig. 26 MIC terminals (view from front panel side)

- 2) Use an insulated adjusting rod to adjust trimmers and coils.
- 3) To prevent damaging SSG, never connect the microphone to mic jack while adjusting the receiver section.
- 4) Be sure to turn the power switch OFF, before connecting the power cable to a power source.
- 5) SSG output levels are those at the time the output terminal is open.
- 6) Meter and display section should be set as follows **Fig. 15**.

## LEVEL DIA

- Note 3. Adjust AC so that the MIC jack input has a 3 kHz DEV with a 1 kHz MOD.
- Note 4. The transmission frequencies are 435.0 MHz and 145.0 MHz.
- Note 5. The HI/LOW switch is set to the HI position.
- Note 6. Except with the ANT terminal, the power meter measurement values are the values with the AFC OFF.

### TSU-6 Frequency Fine-Adjustment

The tone frequency can be fine-adjusted in 0.5% steps, in the range from 0 to +1.5%. For the fine-adjustment, connect T1 (pin 10) and T2 (pin 9) of 101 as indicated in Table 3.

	T1	T2
0%	X	X
+0.5%	○	X
+1.0%	X	○
+1.5%	○	○

○ : GND, X : OPEN

## SPECIFICATIONS

Specifications		Model		TM-721E	
		TM-721A			
		U.S.A. version	Other markets version		
General	Frequency range	144 to 148 MHz 438 to 450 MHz	144 to 148 MHz 430 to 440 MHz	144 to 146 MHz 430 to 440 MHz	
	Mode	F3E (FM)			
	Antenna impedance	50 ohms			
	Power requirements	13.8 VDC $\pm$ 15%			
	Ground	Negative			
	Current drain	Transmit mode (Max.)	9.5 A		
		Receive mode with no signal	0.6 A		
	Operating temperature	-20°C to +60°C (-4°F to +140°F)			
	Dimensions (W x H x D) (Projections included)	150 x 50 x 219 mm (5.9" x 2" x 8.6")			
	Weight	1.8 kg (3.97 lbs)			
Transmitter	Output power*	HI	144 MHz: 45 W, 430/440 MHz: 35 W		
		LOW	5 W		
	Modulation	Reactance modulation			
	Spurious radiation	Less than -60 dB			
	Maximum frequency deviation	$\pm$ 5 kHz			
	Audio distortion (at 60% modulation)	Less than 3% (300 to 3000 Hz)			
	Microphone impedance	500 to 600 ohms			
Receiver	Circuitry		Double conversion superheterodyne		
	Intermediate frequency	U.S.A. version	144 MHz: 16.9 MHz/455 kHz, 440 MHz: 21.6 MHz/455 kHz		
		Other market	144 MHz: 10.7 MHz/455 kHz, 430 MHz: 30.825MHz/455 kHz		
	Sensitivity(12 dB SINAD)		Less than 0.16 $\mu$ V		
	Selectivity		-6 dB: More than 12 kHz, -60 dB: Less than 24 kHz		
	Spurious response		Better than 60 dB		
	Squelch sensitivity		Less than 0.09 $\mu$ V		
	Output		More than 2 W across 8 ohms load (5% distortion)		
External speaker impedance		8 ohms
