### HF SSB TRANSCEIVER

## FEATURES/CIRCUIT DESCRIPTION

memorized frequency and the VFO frequency is shown at the right side, continuously changing as the main tuning is changed.

- Blinking decimal points indicate "out of band"
- Monoscale dial also provided.

### 5. Improved dynamic range, with optimum cross-modulation rejection.

- RF AGC, using a pin diode between the antenna input and RF amplifier-Attenuating is accomplished by the mixer's AGC output, due to superior characteristics of forward bias current versus high-frequency resistance. Thus, the RF-amplifier bias voltage is set automatically for optimum cross-modulation rejection.
- RF attenuator, with fixed AGC voltage for about 20 dB of attenuation.

### 6. Single-conversion system with highly advanced PLL circuit.

- Uses only one crystal.
- Improved stability and spurious characteristics.

### 7. Easy-to-use MODE switch.

Automatic selection of upper and lower sideband with BAND switch. SSB NORMAL and REVERSE positions on MODE switch.

- CW NARROW and WIDE positions, allowing narrowband operation on CW with the optional YK-88CW filter — a low-pass audio filter is inserted in the WIDE position.
- FSK position for RTTY operation, providing a 170-Hz frequency shift.

### 8. RF speech processor.

- Increases average audio level and average transmit power by maintaining constant IF amplifier output independent of the microphone output.
- Selectable SLOW and FAST time constants. SLOW (long) time constant provides more natural audio, whereas FAST (short) increases talk power.

### 9. Dual SSB IF crystal filter system

- Second filter (YK-88S) is optional. IF circuits are common for both transmission and reception.
- Improves signal-to-noise ratio and increases selectivity.
- Provides excellent audio compression when transmitting, while preventing sideband expansion (splatter).

### 10. Tunable noise blanker (adjustable noise-sampling frequency.)

### 11. Dual RIT (receiver incremental tuning). Operates on VFO and FIX/MEMORY positions, with separate concentric controls.

### 12. Variable-pitch CW sidetone (internal adjustment).

### 13. IF SHIFT moves passband away from interfering signals.

### 14. Fixed channel (for net and similar applications), when crystal is added.

### 15. Built-in VOX circuit.

- Automatic transmission by voice. VOX GAIN and DELAY controls on front panel.
- Semiautomatic keying on CW. Time constant automatically 2/3 shorter than on SSB.

### 16. Variety of rear-panel provisions:

- IF OUT 1, IF OUT 2..... for observing waveforms
- XVTR terminal..... for transverters
- ACSY terminal..... for linear amplifier and other optional accessories
- EXT VFO terminal..... for external VFO
- RF ANT..... for separate antenna for receive only
- KEY terminal..... for CW key
- RTTY terminal..... for radioteletype operation
- SP terminal..... for external speaker
- ANTI VOX control..... for antitrip of transmit from receiver audio during VOX operation

### 17. Full line of matching accessories.

- PS-30 base-station power supply.
- SP-180 external speaker with selectable audio-filters.
- VFO-180 remote VFO
- AT-180 antenna tuner/SWR and power meter/antenna switch
- DF-180 Digital Frequency Control (if TS-180S is purchased without DFC)
- YK-88C CW filter
- YK-88S SSB filter

## CIRCUIT DESCRIPTION

### Receiver Section

The receiver section of the TS-180S is fundamentally of a single-conversion type with an IF of 8.83 MHz (only the NB circuit has a double-conversion system).

The input signal from the ANT or RX ANT is first applied to the RF ATT circuit consisting of PIN diodes D1 and D2 (BA379 × 2), then applied to the antenna coil via the IF trap. The input signal level is stepped up by the antenna coil, and then amplified by RF AMP Q3 (3SK73). The amplified signal is applied to the balanced mixer consisting of junction-type FETs Q7 and Q8 (2SK125 × 2), via the source follower Q6 (2SK125), where the VCO output is mixed with the input signal and the 8.83 MHz IF signal is generated. The IF signal is divided and sent to two circuits in the IF unit, where one half is amplified by Q3 (2SA1015) and diode detected. It is then amplified and used to control the RF ATT circuit. The other half is applied to the buffer amplifier, then divided again and sent to the ceramic filter assembly and the NB mixer, Q6, (2SK19). The signal through the ceramic filter is amplified by the FET amplifier Q2 (2SK19), then applied to the NB gate consisting of four 1S1587s diodes. The signal applied to Q6 is mixed with the local-oscillator signal (9285 ± about 74 kHz variable) and the 455 kHz signal is generated. The 455 kHz signal is amplified by Q7, Q8, and Q9 (2SC460 × 3) and then detected. The detected signal is applied to the three-stage amplifier to switch the NB gate. The NB gate output is applied to the three-stage amplifier, Q15, Q16, and Q17 (3SK73 × 3), via the SSB (or CW) crystal filter, then applied to the buffer amplifier, Q35 (2SC460), via the (optional) SSB crystal filter. This buffered signal is heterodyned with the CAR oscillator output at the product detector consisting of two 1N60 diodes to produce the audio signal. The audio signal is amplified by the buffer amplifier, Q29 and Q30 (2SC1000 × 2), then applied to the AF amplifier AN315 via the AF GAIN control, and the AF amplifier drives the speaker.

### Transmitter Section

The voice signal from the microphone is amplified by the MIC amplifier, Q32 (2SC1000), then applied to the MIC amplifier Q33 (TA 7140) via the MIC GAIN control. The MIC input matches a microphone of 500 Ω ~ 50 kΩ. A 20 dB attenuator is available if the microphone output level is too high (by a pin jumper on the IF unit). The MIC amplifier output is applied to the balanced modulator (1N60 × 4) where the signal is switched by the CAR, and a DSB signal is generated. The DSB signal is buffered by Q35, then filtered by the crystal filter to produce the SSB signal. The SSB signal is amplified by

## CIRCUIT DESCRIPTION

the three-stage IF amplifier (which is shared with the receiver section). This amplifier is also used as the processor compression amplifier. The compression amplifier always operates, and turning the processor ON and OFF is performed by switching the compression-amplifier ALC time constant. The amplified SSB signal is applied to the optional SSB crystal filter which filters the sideband widened by the processor. (If the optional filter is not used, turn the switches on the IF unit to the ATT position). Even if the optional filter is not used, effectiveness of the processor will not be decreased. The filtered signal is then applied to IF amplifier Q22 (3SK73), where RF POWER and ALC functions (external, internal ALC, and XVTR ALC) are applied. The amplified SSB signal is then mixed with the VCO output by the balanced mixer Q4 and Q5 (3SK73  $\times$  2) in the RF unit, and the SSB signal of the desired frequency is obtained. The mixer output is applied to the amplifier Q1 (3SK73) via a tuned circuit in the Coil Pack unit. At this stage, the gain compensation for each band and power decrease at protection are carried out. The signal amplified by Q1 is filtered by the BPF and amplified by the wide-band amplifier Q2 and Q3 (2SC1519 and 2SC741). This amplifier drives the 10 W Driver stage. In the 10 W Driver stage, the drive output is amplified by Q1 (2SC2075), then amplified by the push-pull amplifier Q2 and Q3 (2SC2509  $\times$  2), and 10 W output is obtained. The 10 W stage drives the final push-pull amplifier consisting of two SRF-1714s. The final output is fed to the antenna via the LPF and the antenna relay. In the 100 W final stage, the temperature of the output transformer is detected and in the LPF unit, the ALC signal is detected. For CW operation, the switching transistor Q10 (2SC734) in the RF unit controls the balanced mixer Q4 and Q5 (3SK73  $\times$  2) in the RF unit and the amplifier Q4 (3SK73) in the Coil Pack unit. Positive (+) keying is used in TS-180S. Transmission and reception are switched by four relays (nine circuits).

### Noise Blanker

Fig. 1 Noise detecting band width of former noise blanker

In former circuits, the passband of the noise amplifier was fixed to  $\pm 10 \sim 20$  kHz of the receiving frequency. If a strong signal existed near the received signal, noise separation usually deteriorated. This disadvantage could not be avoided with such a circuit. In the TS-180S, a local oscillator and mixer are provided for the noise amplifier and the signal is con-

verted to 455 kHz, and then noise components are separated. The passband of the noise amplifier is determined by BPF, and the passband center can be shifted to an optimum frequency within a range of about  $\pm 100$  kHz off the receiving frequency. Therefore, a strong interfering signal can be avoided and noise separation can be done efficiently.

Fig. 2 Formal noise blanker

If a strong signal is within the passband of the noise amplifier, a noise-amplifier AGC voltage is generated by the strong signal and noise detection function is blocked. In the Amateur bands, there is every likelihood of a strong signal existing (a local ham station, a BC station, etc.) within the passband of the noise amplifier Fig. 2.

If the passband center of the noise amplifier is shiftable, interference from other stations can be avoided with stable detection of the noise component only. And, there is scarcely any difference in the waveform of the noise within the receiving range and that within the passband of the noise amplifier because frequency shift is very small Fig. 3.

Fig. 3 TS-180 Noise blanker

### Speech Processor

In the TS-180S, the receiver IF amplifier is also used as the compression amplifier for transmission. As the gain of the IF amplifier is too high, it is decreased during transmission by increasing the source resistors of the second and third amplifier stages. An individual AGC system is provided for transmission. The processor always operates during transmission. Two selectable time constants are provided; when SLOW is selected, the time constant is sufficiently long and natural and voice tone is not lost. When FAST is selected, the time constant is short and talk power of the transmitted signal is increased. In either case, compression-amplifier peak level is kept constant, so no further adjustment is required when the

## CIRCUIT DESCRIPTION

time constant is changed. Normally, the compression level reading is about 10 dB on the COMP meter. When the optional SSB filter is installed, the compression level can be increased up to 20 dB with the selector at FAST because the widened sideband is filtered.

In former transceivers such as the TS-520, only the crystal filters, the first stage of the IF amplifier, and the mixer coils were shared by the transmitter and the receiver. However, as the receiver AGC loop operates on the same principle as the RF compressor, the IF amplifier of the receiver is also used as the speech processor for transmission in the TS-180S.

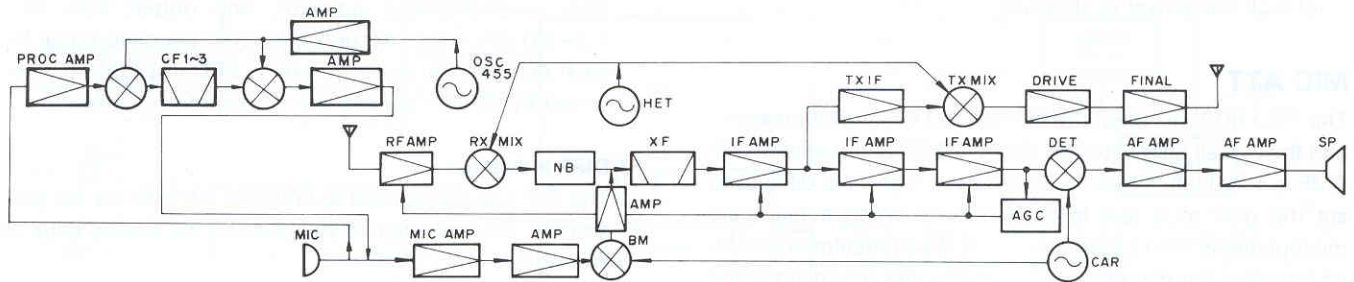

Fig. 4 TS-820 RF Speech processor

Fig. 5 TS-180 RF Speech processor

### RF Power Control

RF power level can be changed by adjusting the RF POWER control on the front panel. The RF POWER control decreases the ALC time-constant reference voltage (normally 3.6 V), which decreases the transmitter IF amplifier gain. Thus, the drive level is decreased, and with it the RF power. The circuit operates in the same way as the variable-threshold receiver RF GAIN control.

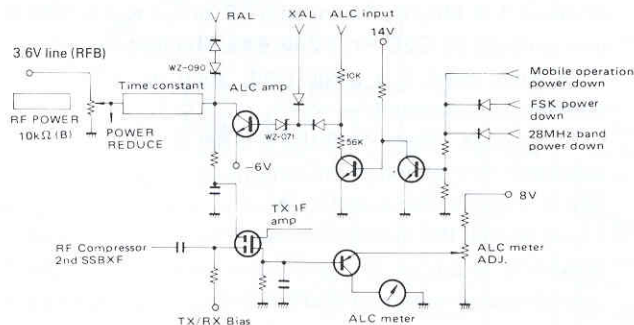

Fig. 6 RF POWER CONTROL RF POWER SWITCHING

### IF Double Filters

The following advantages are obtained by adding the SSB crystal filter to the IF-amplifier output. 1) improvement of S/N ratio, 2) improvement of selectivity for a single signal on reception, and 3) a deeper compression level. Each advantage is amplified below.

1) External noise and noise generated in the RF or MIXER stage can be reduced by the IF-amplifier input filter used in

existing transceiver circuits. However, for noise generated in the IF amplifier, only the filtering function of the succeeding AF stage is effective. For example, when the AF frequency range is 200 Hz ~ 3 kHz and the carrier frequency is 8331.5 kHz (USB), noise existing within the range of 8831.7 ~ 8834.5 kHz and 8831.3 ~ 8828.5 kHz is output from the AF stage of a receiver using an input IF filter only. However, if a crystal filter of  $8830.0 \pm 1.2$  kHz (e.g. YK-88S) is added between the IF amplifier and the detector, only the IF noise existing within 8831.2 ~ 8828.2 kHz is output. As a result, the IF noise is decreased by about 3 dB when viewed from the AF output. The overall S/N ratio is not decreased by 3 dB because it is determined by not only the IF noise but also by the noise generated in the previous RF stages. In the TS-180S, however, when the IF SHIFT is varied to a large extent, the IF noise has a greater influence on S/N ratio than usual and the additional filter is useful. Even if the IF SHIFT is centered, the additional filter sharply cuts off the AF signal high-frequency component and so decreases audibility of the output noise.

2) An ordinary crystal filter is included in the AGC loop, so that, when the tuning frequency is shifted up and down while a strong signal is received, the apparent selectivity for a single signal viewed from the output is deteriorated by the AGC. As the additional filter is not in the AGC loop, the apparent selectivity viewed from the output is just the selectivity of the filter regardless of the level of the received signal. Thus, the high-frequency beat heard at off-tuning can be avoided.

3) The RF compressor speech processor used in the TS-180S

## CIRCUIT DESCRIPTION

eliminates splatter normally generated by compression. Expansion of the sideband on compression is usually negligible. However, if the compression level is increased to 30 dB during FAST time-constant operation, sideband expansion is somewhat critical. With the additional filter, the sideband signal is again filtered and a high-quality SSB signal of high talk power is obtained.

### MIC ATT

The TS-180S includes a maximum 30 dB of compression, and the overall gain between the MIC AMP and transmitter IF AMP is very high. When the gain is too high, it is difficult to set the gain to a low level, especially when a high-gain microphone is used. Therefore, a 20 dB attenuator is provided between the microphone connector and the microphone amplifier so that the compression amplifier gain can be easily set. Switching the attenuation level (0 dB — 20 dB) is performed by changing a jumper pin on the IF unit.

### Transmission Power Selection (ALC Start Level Selection)

The ALC voltage from the LPF unit is resistor-divided in the IF unit, then applied to the ALC amplifier. By changing the dividing ratio the ALC start level (i.e., the transmission power which is controlled by the ALC) is varied. The dividing ratio is transistor-switched, which is controlled by the diode matrix to which signals from MODE SW and BAND SW are applied.

### Frequency Divider Unit (X54-1420-00)

This unit divides the 8 MHz reference signal from the PLL unit and generates the GAT, RST, and LTH signals for the display unit and the memory assembly. Q1 and Q2: 8 MHz input amplifier; Q3: 1/16 divider; Q4: 1/100 divider; Q6: buffer (between C-MOS and TTL); Q7: 1/10 divider; Q8 and Q9: timing generator; Q10: output buffer.

### Display Unit (X54-1430-00)

#### 1. Outline of unit

The unit consists of the counter, display driver, tone signal circuit, 5 V and -24 V power supply and the interface to the external switches. These are all controlled by the microprocessor Q20.

#### 1 Counter

Four-digit data (4 bits  $\times$  4) of 100 Hz ~ 100 kHz counted by Q12 ~ Q14 are divided into two groups of 4 bits  $\times$  2 by the data selector and input to the microprocessor two digits by two digits. The data selector is controlled by the output of Q20, Pin 25 (R3). The data are input to Q20, Pins 26 ~ 29 (R4 ~ R7) and 34 ~ 37 (R12 ~ R15) and stored in the microprocessor RAM, at the trailing edge of the GATE signal (input to Pin 4: IRQ).

#### 2 Display

B0 ~ B3 data are generated by the PLL and input to Pins 33 ~ 41 (K0 ~ K3). These data are for MHz and tens of MHz digits for each Amateur band and are combined with the stored four-digit data of 100 Hz ~ 100 kHz. Then, digit data is converted to 8-bit data to drive the corresponding seven-segment indicator, and output from Pins 13 ~ 20 (00 ~ 07). At the same time, the drive signal for each digit (4 bits) is output and is BCD-to-DECIMAL converted by Q23 to operate the corresponding indicator.

#### 3 DIFF indication

The DIF signal is applied to Q20 Pin 31 (R9) via the gate and FF. The indication is switched by the trailing edge of this signal.

#### 4 Memory indication

The signal from DIS is applied to Q20 Pin 30 (R8) via the latch. At the trailing edge of this signal, the frequency currently indicated is memorized. When the memory operation is completed, the microprocessor issues the tone drive signal from Pin 23 (R4) to drive the tone circuit. The tone circuit can be inhibited by shorting the terminals on the tone unit. The tone signal sounds at 2.8 kHz for 30 ms. The frequency and time are determined by C9 and R18, and C8 and R16, respectively.

#### 5 Off-band indication

When the indicated frequency is out of an amateur band, two decimal points, which are lighted continuously regardless of NOR or DIFF indication, flash to notify the operator that the frequency is out of band.

#### 6 Other Circuits

Clock generator for the microprocessor: Generates a clock of about 1.4 MHz by means of a CR circuit (C7 and R14) and outputs to Q20 Pin 12 (X.EX). The frequency varies extensively even if a small load, such as a frequency counter, is connected.

RESET circuit: When Pin 3 (RST) is set to "L", the microprocessor is reset and all the outputs are initialized to "H". The 5 V line is connected to Pin 3 via a CR time-constant circuit so that the microprocessor is automatically reset at power-on. A circuit to prevent the microprocessor from operating erroneously is also connected to Pin 3. This circuit consists of Q4, Q21, and D1. It compares the 5 V line voltage with the reference voltage (4 V) across D1 and resets the microprocessor if the 5 V line voltage is below 3.4 V.

### 10 W Driver Stage (X56-1330-00)

In the 10 W Driver stage Q1 (2SC2075) amplifies the input signal to drive the push-pull amplifier consisting of Q2 and Q3 (2SC2509  $\times$  2). The circuit configuration is almost the same as that used in the TS-120S. Q4 (2SC496 (Y)) supplies the

# CIRCUIT DESCRIPTION

Fig. 7 Display unit block diagram

Fig. 8 Divide unit schematic diagram

## CIRCUIT DESCRIPTION

bias voltage to Q2 and Q3. Final-stage idling current is adjusted by VR1 (idling current is 100 mA for both Q2 and Q3). The voltage drop across L9 (6.6  $\mu$ H) is measured by the Ic meter so that total collector current of Q2 and Q3 is displayed. 5.1 V is applied to the LPC terminal to bias Q1, Q2, and Q3 during transmission (0 V during reception).

### 100 W Final Stage (X56-1340-00)

The 10 W Drive output is applied to the matching transformer T1. The final amplifier is a push-pull amplifier consisting of Q1 and Q2 (Motorola SRF1714  $\times$  2) which outputs a power of 100~120 W. T1 and T2 are input and output matching transformers, respectively.

The voltage drop across L8 (15  $\mu$ H) is applied to the Ic meter via the MIP terminal. 5 V is applied to the HPC terminal to turn ON the bias control transistor Q3 (2SD235) during transmission. A thermostat (120°C) is attached to the output matching transformer. When the core temperature of the output transformer reaches about 140°C, the thermostat opens. When the thermostat is open, about 13 V appears on the THP terminal.

Fig. 9 LPF unit (ALC, SWR, PROTECTION, RF METER)

### TS-180 FREQUENCY CONFIGURATION

The TS-180 is a single conversion system transceiver using a unique PLL circuit (see Fig. 10).

The frequencies of the TS-180 is basically the same as those of TS-120, but the PLL circuit of the TS-180 is different from that of the TS-120.

The principal difference between TS-180 and TS-120 are as follows:

- 1) Receive frequency of JYJ/WWV has been changed from 15 MHz to 10 MHz.
- 2) The 1.8 MHz band covers 1.5-2.0 MHz. The band mark has been changed to read "1.5". (VCO covers 10.33-10.83 MHz)
- 3) Two AUX bands can be added (1 band covers up to 15 MHz).

### PREMIX UNIT (X50-1570-00)

Oscillation frequencies from CAR, VFO (MEMORY, RMT-VFO, FIX-CH) and FUNCTION/RIT are mixed together to produce output signal of 48.83-49.33 MHz which is fed to the PLL unit, while signal of 40.0-40.5 MHz, not mixed with CAR frequency, is fed to the counter circuit (indicator unit).

Fig. 11 shows a block diagram of the premix circuit.

Signals (6.6-6.1 MHz) from VFO, FIX-CH, MEMORY and RMT-VFO are selected by switching diodes (D1-4, 4-IS1587) and fed to the double-balanced mixer Q7 through LPF (8 MHz) and buffer amplifier Q4, while the output selected by the switching diodes fed to the MEMORY unit counter through the buffer amplifier Q3.

The signal from FUNCTION/RIT Q5 determined by MODE, passes through the buffer amplifier Q6 and LPF (50 MHz) and is fed to Q7 where it is mixed with VFO signal to produce 40.0-40.5 MHz signal. This signal passes through IFT T1 and T2, double-balanced mixer Q11 and buffer amplifier Q9, and is fed to the counter circuit of the indicator unit.

The signal from CAR Q13 determined by MODE, is fed to Q11 through the 2-stage buffer amplifier (Q14, 15) and LPF (10 MHz), where it is mixed with 40.0-40.5 MHz to produce 48.83-49.33 MHz. This signal is fed as a premix output to the PLL unit through IFT (T3, T4) and the buffer amplifier Q12.

### PLL ASS'Y UNIT (X60-1120-11)

The PLL ass'y unit is different from the TS120 PLL unit in the following points:

- 1) Multi-band VCO (capacitors are selected by switching diodes according to band).
- 2) With DC input from band switch and VCO, the following information are produced by matrix unit.
  - ① Band information (4bits) is outputted to indicator unit (counter circuit).
  - ② Setting of frequency division ratio (8 bits) of programmable divider.
  - ③ Setting of SSB mode by band.
  - ④ Switching of BPF of PLL circuit by band.
- 3) Standard oscillator (8 MHz) to feed signal to outside (indicator unit and memory unit).
- 4) Adoption of switching type prescaler of 1/4 and 1/5 in programmable divider.
- 5) Use of 5 V local regulator (IC power).
- 6) Use of SN76514N in double-balanced mixer.

Fig.12 shows a block diagram of PLL circuit, and Table 1 shows frequency arrangement. The operating principle of PLL circuit is as follows (refer to Fig. 12):

Frequencies (premix output) of 48.83 to 49.33 MHz from the premix unit and the VCO frequency of each band are mixed together in the double-balanced mixer to produce frequencies given in Table 2.

# CIRCUIT DESCRIPTION

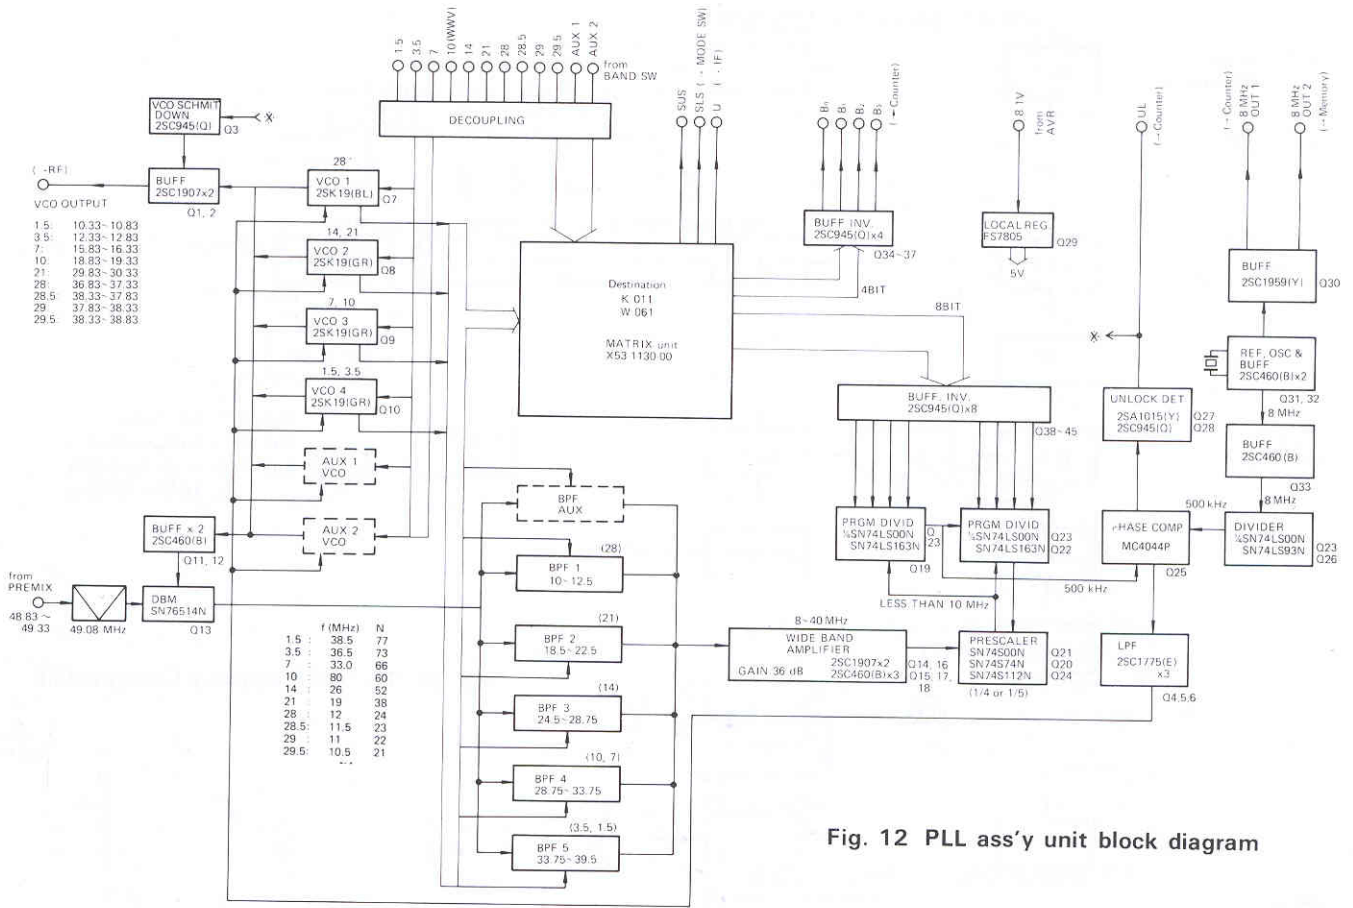

Fig. 12 PLL ass'y unit block diagram

The frequency obtained is fed to BPF1-BPF5 (and AUX) and is amplified to about 36 dB by the 8-40 MHz amplifier. This frequency is shaped into a digital wave and is divided by the prescaler and the programmable divider to obtain 500 kHz output. The information from the band switch and VCO is converted into 8-bit BCD signal by the matrix unit. By presetting this signal, the frequency is divided at the ratio given in Table

Band information is fed from the matrix unit to the indicator unit (counter circuit). The information includes 4-bit BCD

signal, LSB signal (less than 7 MHz) and USB signal (more than 10 MHz).

The phase comparator Q25 uses MC4044P of Motorola Co. The loop filter amplifier is composed of transistors mounted on the outside to minimize spurious radiation.

The reference oscillator uses 8 MHz crystal element with Q32 2SC460. The oscillation frequency is fed through the buffer amplifier to the external units (display unit and memory unit).

the frequency from the buffer amplifier Q33 is divided by

Table 1 Frequencies of each unit

Band	Transmit/receive frequency	VCO frequency	MIX A (Q13) output frequency	Frequency division (N)

# CIRCUIT DESCRIPTION

Q23 and Q26 to produce 500 kHz comparison signal which is fed to the phase comparator Q25.  
 The VCO oscillator is composed of 6 VCOs covering 3.5 MHz, 10 MHz, 14 MHz, 21 MHz, 28 MHz bands and 2 AUX bands (option).

If the oscillator is locked for any reason, it is detected by the phase comparator output to shut off the VCO output. This prevents the radiation of unwanted signals and blanks the digital display.

## MEMORY ASS'Y UNIT (X60-1090-00)

The memory ass'y consists of Control and VCO units. These units in combination constitute as a presettable up-down digital VFO.

It has the following features :

- 1) The heart of the memory ass'y consists of a 4-bit microprocessor and a dual PLL circuit.
- 2) Up to 4 channels of VFO frequencies are presettable.
- 3) The memory shift (M. SHIFT) feature provides the digital VFO function. The oscillator covers a variable frequency range of approx. 700 kHz. Digital frequency control is possible over this frequency range at 20 Hz interval.
- 4) A memory back-up battery, which maintains the contents of memories M, M', and M'' intact even when the power to the unit is turned off, is accommodatable.

### 1. Control Unit (X53-1100-00)

The control unit consists of a counter, data selector, astable multivibrator, RS flip-flop, external RAM, 5V-AVR, and interface with external switches. All the data to and from these circuits are controlled by microprocessor Q23 (TMC 1010) and transferred to the VCO unit.

The block diagram of the control unit is shown in Fig. 13.

Fig. 13 CONTROL unit block diagram

# CIRCUIT DESCRIPTION

## Microprocessor Operation:

### 1) Counter control

The signal (6.1 to 6.6 MHz) from MRO terminal goes to data selector Q21 together with the 5 digit data (10 Hz to 600 kHz) converted into 4 bit BCD code. The data selector is controlled by the output of pin-25 (R3) of Q23.

The digit-serial BCD output is coupled to pins 38 to 41 (K0 to K3) of Q23 and stored in a RAM within the microprocessor. This sequence is activated at the trailing edge of the gate signal (IRQ: pin 4) on MEMORY INPUT operation.

### 2) Memory operation

A positive pulse generated by MEMORY IN operation goes to data selector Q18 via RS flip-flop Q17. (The output of the f.f. also goes to pin 4 (IRQ) of Q23 as a GATE signal.)

The MEMORY OUT operation goes to data selector Q18 in accordance with read command from the selector circuit. The selected data goes to pins 30 and 31 of Q23.

### 3) UP/DOWN and SCAN operations

When the UP mode is selected, an H level signal goes to RS flip-flop Q19, and when the DOWN mode is selected, an L level signal couples to pin 32 (R10) of Q23.

The scanning circuit consists of astable multivibrator Q20 and 1/N divider. The dividing ratio is controllable over 1/N + 50% with VR1. In the SLOW SCAN mode, all the sections of Q20 operate and its output goes to pin 8 (TC) of Q23 via buffer Q19.

In the FAST SCAN mode, the 1/N divider in Q20 stops operation. The microprocessor operation is illustrated in Fig. 14.

### 4) Memory back-up feature

When Q5 and Q6 detect the supply voltage (normally + 14 V) lowered below 9 volts, terminal R0 of the microprocessor is compulsorily held to L level. Consequently, the RAM address is output through 00 05 (6 bits), and BCD data stored in the CPU memory is output through R4 R7 (4 bits) to save them on the RAM.

This data saving is accomplished in approx. 600 sec. When the power is restored, RAM content is checked whether it remains intact or not. If the RAM content remains intact, it is transferred to the memory in the microprocessor. If the RAM content is broken, all the channels are reset to "0" (a frequency corresponding to "0" on the VFO dial).

## 2. VCO Unit

The VCO unit consists of two sets of VCO, programmable divider (N:7 bit binary and M:11 bit BCD), mixer, phase detector, reference oscillator/divider, and 8V-AVR circuits. Its VCO frequency being controlled by the control unit, the VCO unit output memory frequencies from 6.6998 MHz to 6.00002 MHz at 20 Hz interval.

The block diagram of the VCO unit is shown in Fig. 15, and a memory frequency chart is given in Table 3.

The 1st VCO oscillates at 20.02 MHz to 30.0 MHz, which is divided by Q28's 1/2 divider into 10.01 MHz to 15.0 MHz. The VCO output then goes to "M" programmable divider Q31 (11 bit BCD) where the frequency is divided by M

Fig. 14 Microprocessor explanation

Fig. 15 VCO unit block diagram

# CIRCUIT DESCRIPTION/SEMICONDUCTOR DATA

(M = 1001 to 1500) into 10 kHz, and converted into the 1st VCO voltage by phase detector Q33.

The 1/2 divided 1st VCO output of 10.01 to 15.0 MHz also goes to 1/5 and 1/100 divider, then to the 1st mixer (D7 to D9) where it is mixed with the reference oscillator frequency of 8 MHz and converted into 7.97998 MHz to 7.970 MHz. These frequencies, after filtered through the MCF and amplified, go to the 2nd mixer (Q11). In the 2nd mixer, the signal is mixed with the 2nd VCO frequency to be converted into 1.28 to 1.97 MHz. It then goes to "N" programmable divider Q27 (7 bit binary code) where it is divided by N into

10 kHz, then converted into the 2nd VCO voltage by phase detector Q26.

The reference frequency for phase detectors Q23 and Q33 is created by first amplifying the 8 MHz reference frequency by Q34 and Q35, then dividing it into 10 kHz by divider Q36 to Q38. The 2nd VCO oscillates frequencies from 6.00002 MHz to 6.6998 MHz. These frequencies are coupled to the memory output via buffers Q1 and Q2.

These memory frequencies turn on/off Q1 and Q2 with the MEMORY operation switch.

**Table 3 F memory frequency table:**

Operating frequency (MHz) * 1	Memory output frequency (MHz) ⑤	Mixer input frequency (MHz) ③	N input frequency (MHz) ④	N	1/500 output frequency (kHz) ①	M input frequency (MHz) ②	M
13.900.00	6.699.98	7.979.98	1.280	128	20.02	10.01	1001

## ▼ VCO UNIT (X50-1550-00)

# PARTS LIST

**Note 1:**

K. U.S.A. T: Britain W: Europe X: Australia

**Note 2:**

Only special type of resistors (example: cement, metal film, etc.) and capacitors (example: electrolytic, tantalum, mylar, temp. coeff. capacitors) are detailed in the PARTS LIST. For the value of all common type components, refer to the schematic diagram of the P.C. board illustration. Resistors not otherwise detailed are carbon type (1/4W or 1/8W). Order carbon resistors and capacitors according to the following example:

A carbon resistor's part number is RD14BY 2E222J.

A ceramic capacitor's number is CK45F1H103Z, CC45TH1H220J.

**RESISTOR**

**1. Type of the carbon resistor**

**2. Wattage**

1W → 3A    3W → 3F    5W → 3H  
2W → 3D    4W → 3G

**6 = Tolerance**

Cord	C	D	G	J	K	M	X	Z	P	No cord
(%)	±0.25	±0.5	±2	±5	±10	±20	+40 -20	+80 -20	+100 -0	More than 10μF -10~+50 Less than 4.7μF -10~+75

**Less than 10 pF**

Cord	B	C	D	F	G
(pF)	±0.1	±0.25	±0.5	±1	±2

**3 = CK45F**

Ceramic capacitor (type I) 3

Cord	B	D	E	F
Operating temperature °C	-30 +85	-30 +85	-30 +85	-10 +70

**3' = CC45 ○○ ....**

Ceramic capacitor (type II) temperature coeff. capacitor .1' 3'.

1st word (Color)	CH (Black)	LH (Red)	PH (Orange)	RH (Yellow)	SH (Green)	TH (Blue)	UJ (Violet)
ppm/°C	0	-80	-150	-220	-330	-470	-750

**3. Resistance value**

Significant figure      Multiplier  
Example: 221 → 220Ω    223 → 22 kΩ    225 → 2.2 MΩ  
                 222 → 2.2 kΩ    224 → 220 kΩ

**4. Tolerance**

J = ±5% (Gold)      K = ±10% (Silver)

**CAPACITORS**

**Type I**

**Type II**

CK	45	F	1H	103	Z	CC	45	TH	1H	220	J
1	2	3	4	5	6	1'	2	3'	4	5	6

1 = Type ..... ceramic, electrolytic, etc.    4 = Voltage rating  
2 = Shape ..... round, square, etc.        5 = Value  
3 = Temp. range                                    6 = Tolerance  
3' = Temp. coefficient

**5 = Capacitor value**

Example: 010 → 1 pF  
                 100 → 10 pF  
                 101 → 100 pF  
                 102 → 1000 pF = 0.001 μF  
                 103 → 0.01 μF

CC45 ....

Type II

CK45 ....

Type I

**GENERAL Schematic: Page 72**

### PACKING

# EXPLODED VIEW/DISASSEMBLY

**Fig. 32 Front panel exploded view**

**Fig. 33 Rear panel disassembly**

# DISASSEMBLY/LEVEL DIAGRAM

## <How to install the MEMORY ASS'Y unit>

- (1) Remove four screws from the IF unit (X48-1240-11).  
(as shown at right) Fig. 35.
- (2) Remove two connector (37, 38) from the Connector unit  
(x 41-1190-00).
- (3) Remove two screw from the Connector unit.
- (4) Installed four screw from the MEMORY ASS'Y unit  
(x 60-1090-00).
- (5) Connect the 37 38 Conector on the MEMORY ASS'Y  
unit.

## <To gain access to the RF unit>

- (1) Remove four screw from the PLL ASS'Y unit  
(x 60-1120-11).

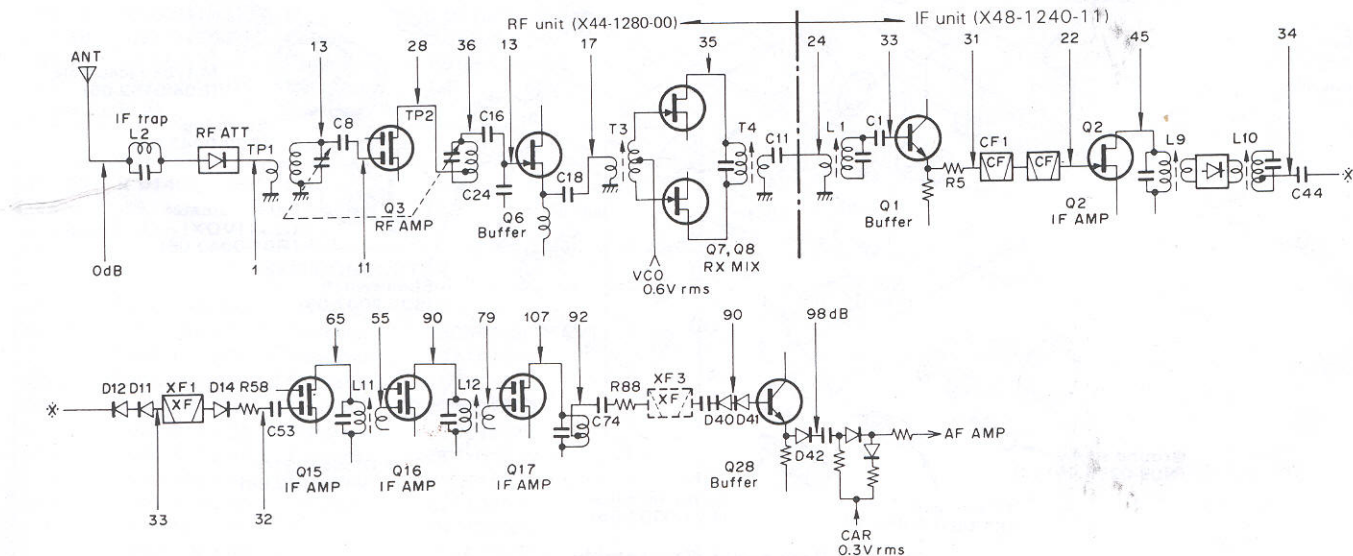

Fig. 34 Repairing the RF unit

Fig. 35 Install the MEMORY ASS'Y unit

## RECEIVER SECTION

# LEVEL DIAGRAM / ADJUSTMENTS

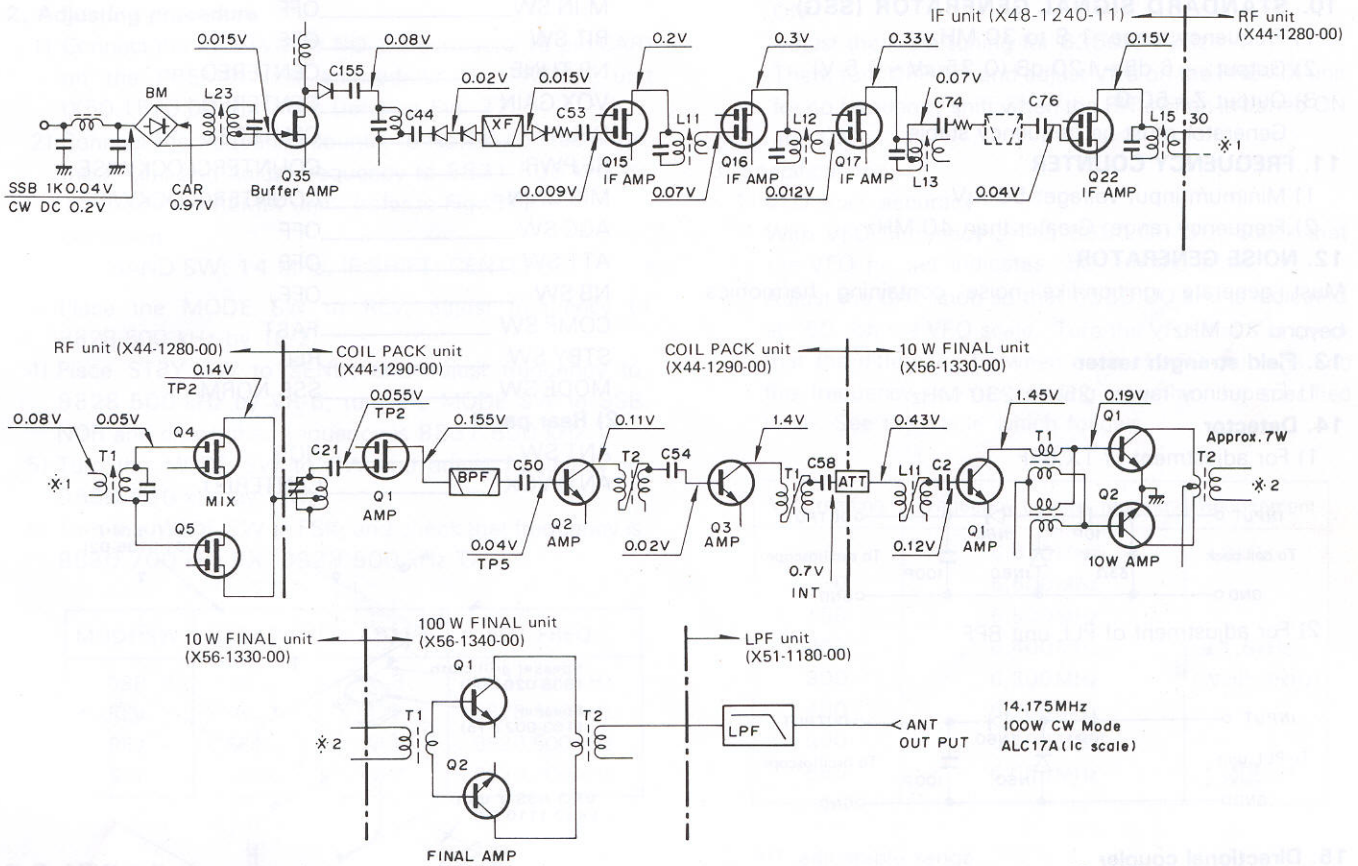

**NOTES:**

1. The figures shown are signal generator output required for a constant audio output with a constant AF gain control setting. Set the AF gain control for 0.63V/8Ω (50 mW) audio output 0 dB signal generator input at

14.2 MHz.

2. To inject signal generator output connect a 0.01μF 500V capacitor between the signal generator and the check point.

**TRANSMITTER SECTION**

All voltage measurements are read from on RF VTVM.

**ADJUSTMENTS**

**GENERAL**

Adjustment procedures for this transceiver are classified into formal adjustments requiring a full service bench and simplified adjustment using a VTVM, AF and RF VTVM, AG, and AF and RF dummy load. Complete adjustment also requires a frequency counter, SSG, sweep generator and etc.

**TEST EQUIPMENT REQUIRED**

**1. VTVM or DVM**

- 1) Input resistance: More than 1 MΩ
- 2) Voltage range: 1.5 to 1000 V AC/DC

**NOTE:** A high-precision voltmeter may be used. However, accurate readings can not be obtained for high-impedance circuits.

**2. DC current meter**

- 1) Current range: 100 mA, 200 mA, 2A, 10A.
- High-precision current meter may be used.

**3. RF VTVM**

- 1) Input impedance: 1 MΩ and less than 3 pF.
- 2) Voltage range: 10 mV to 300 V
- 3) Frequency range: 50 MHz or greater

**4. AF VTVM**

- 1) Frequency range: 50 Hz to 10 kHz
- 2) Input impedance: 1 MΩ or greater
- 3) Voltage range: 10 mV to 30 V

**5. AF GENERATOR (AG)**

- 1) Frequency range: 200 Hz to 5 kHz
- 2) Output: 2 mV ~ 1 V, low distortion

**6. AF DUMMY LOAD**

- 1) Impedance: 8 Ω
- 2) Dissipation: 3 W or greater

**7. RF DUMMY LOAD**

- 1) Impedance: 50 Ω.
- 2) Dissipation: 100 W continuous or greater

# ADJUSTMENTS

3) Frequency limit: 1.8 to 30 MHz

## 8. OSCILLOSCOPE

Requires high sensitivity and external synchronization capability.

## 9. SWEEP GENERATOR

- 1) Center frequency: 8 to 40 MHz
- 2) Sweep bandwidth: Maximum  $\pm 16$  MHz
- 3) Output voltage: More than 0.1 V

## 10. STANDARD SIGNAL GENERATOR (SSG)

- 1) Frequency range: 1.8 to 30 MHz
- 2) Output:  $-6$  dB  $\sim$   $120$  dB ( $0.25 \mu\text{V} \sim 0.5 \text{ V}$ )
- 3) Output Z =  $50 \Omega$

Generator must be frequency stable.

## 11. FREQUENCY COUNTER

- 1) Minimum input voltage: 50 mV
- 2) Frequency range: Greater than 40 MHz

## 12. NOISE GENERATOR

Must generate ignition-like noise containing harmonics beyond 30 MHz.

## 13. Field strength tester

- 1) Frequency range: 25  $\sim$  230 MHz

## 14. Detector

- 1) For adjustment of TX.BPF

- 2) For adjustment of PLL unit BPF

## 15. Directional coupler

## 16. Power supply

- 1) 100 W type: 13.8 V, 20 A min. PS-30 or higher class

## 17. FIX-CH adjusting crystal element

- 1) 6,350 kHz (center: 250 kHz)
- 2) 6,600 kHz (lower band edge: 000 kHz)
- 3) 6,100 kHz (upper band edge: 500 kHz)

**NOTE:** Crystal elements in 2 and 3 are used for confirmation of frequencies.

## PREPARATION

1. Remove the upper and lower cases as shown at right (Figure 36).
2. Unless otherwise specified, set the controls as follows.

### 1) Front panel

- POWER SW \_\_\_\_\_ OFF  
 BAND SW \_\_\_\_\_ 1.5 MHz  
 SHIFT SW \_\_\_\_\_ ON

## 1. Power Supply Adjustment

### 1-1 8 V adjustment

#### 1. Instrument

- 1) DC VTVM

#### 2. Adjusting procedure

Connect the voltmeter between TP-2 and chassis on the AVR

# ADJUSTMENTS

unit (X43-1340-00) and adjust VR1 on the AVR for 8 V. (refer to Fig. 37 Page 57)

## 2. RX Adjustment

### 2-1 Carrier unit adjustment

#### 1. Instruments

- 1) RF VTVM
- 2) Frequency counter

#### 2. Adjusting procedure

- 1) Connect the RF VTVM to NO. 52 connector (6 pin CAR) on the PREMIX unit and adjust T5, PREMIX unit (X50-1570-00) for max. (refer to Fig. 37)
- 2) Connect the frequency counter to No.26 connector on the IF unit and adjust frequency to 8831.500 kHz by TC-3 on the PREMIX unit. (refer to Fig. 37)

#### condition

BAND SW: 14 MHz, IF SHIFT: CENTERED.

- 3) Place the MODE SW to REV, adjust frequency to 8828.500 kHz by TC-2.
- 4) Place STBY SW to SEND, and adjust frequency to 8828.500 kHz by VR-6, turn the MODE SW to SSB NOR and check that frequency is 8831.500 kHz.
- 5) Turn the MODE SW to CW and adjust frequency to 8830.700 kHz by VR7.
- 6) Turn the MODE SW to FSK, and check that frequency is 8830.700 kHz RX, 8828.500 kHz TX.

MODE SW	STBY SW	ADJ.	ADJ. FREQ.
SSB	REC	TC-3	8831,500 kHz
REV	REC	TC-2	8828,500 kHz
REV	SEND	VR-6	8828,500 kHz
CW	SEND	VR-7	8830,700 kHz

### 2-2 VFO adjustment

#### 1. Instruments

- 1) RF VTVM
- 2) Frequency counter

#### 2. Adjusting procedure

- 1) Frequency adjustment.  
Set the RCV push switch to OFF and connect the frequency counter to TP-2 on the PREMIX unit (X50-1500-00).  
Set the VFO to the 50 kHz position and check that the oscillator frequency is 6550.00 kHz. Then, set the VFO to "500" and check that the oscillator frequency is 6100.00 kHz.  
If the frequency is not 6550.00 kHz, correct by TC1 in the VFO ASSY unit. If the frequency is not 6100.00 kHz, correct by L1 in the VFO ASSY unit.  
Since TC1 and L1 adjustments interact repeat these adjustments three or four times.
- 2) Output voltage  
Set the VFO to "250".  
Connect the RF VTVM to TP-2 on the PREMIX unit and

adjust trimmer TC2 in the VFO ASSY unit for 90 mV ( $\pm 1$  dB) output voltage.

**NOTE:** When adjusting output voltage, do not simultaneously connect a frequency counter to TP-2 on the PREMIX unit.

- 3) VFO RIT adjustment (Receiver Incremental Tuning)  
Connect the frequency to TP-2 on the PREMIX unit. Set the RIT control to 0 (center) and turn the RIT switch ON.  
Adjust the main tuning for 6350.00 kHz.  
Then, turn OFF RIT and adjust VR5 on the PREMIX unit for no frequency shift when the RIT switch is turned ON and OFF.

#### 3. Specifications

##### 1) VFO scale accuracy

With VFO frequency set to 6550.00 kHz, check that the VFO pointer indicates "50" on the scale.  
Adjust the CAL knob so that 6550.00 kHz is indicated at "50" on the VFO scale. Turn the VFO dial and check that the difference between each of VFO readings and the frequency counter reading is within the specified limit. See the Table which follows.

VFO reading	Frequency counter reading	Requirement
-50	6,650MHz	$\pm 3$ kHz
0	6,600MHz	
100	6,500MHz	
200	6,400MHz	$\pm 1,5$ kHz
300	6,300MHz	(Width 3 kHz)
400	6,200MHz	
500	6,100MHz	
550	6,050MHz	$\pm 9$ kHz $-2$ kHz

##### 2) RIT adjustable range

With the VFO set to 250 turn the VFO RIT SW ON; Adjust the VFO RIT control to confirm that the frequency varies more than  $\pm 2$  kHz. Turn the VFO RIT SW OFF.

### 2-3 FIX/R, RIT adjustment

#### 1. Instruments

- 1) Quartz crystal 6.350 MHz (FIX CH)
- 2) RF VTVM
- 3) Frequency counter

#### 2. Adjusting procedure

- 1) Install a 6.350 MHz quartz crystal in the PREMIX unit (X50-1570-00).  
Adjust the RF POWER control full counterclockwise. Turn the FIX RIT SW ON, turn the RCV SW, XMIT, SW and RECALL SW ON, and the FIX RIT control centered. Set the MODE SW to SSB NORM position.  
Connect the frequency counter to the 1P terminal (No. 54) on the PREMIX unit, and adjust frequency to 6350.000 kHz by TC 1. (refer to Fig. 37)

# ADJUSTMENTS

- 2) Connect the RF VTVM to TP-2, and check that RF output is 90 mV  $\pm$ 3 dB.
- 3) Connect the frequency counter to the 3P terminal (No. 52) on the PREMIX unit, and adjust frequency to 40250.000 kHz by T6.  
Place the STBY SW to SEND and adjust frequency to 40250.000 kHz by VR-1. Turn the MODE SW to CW position and adjust frequency to 40250.000 kHz by VR-2.
- 4) With the STBY SW set to REC, depress DSP/M1 and DSP/DIFF SWs in that order while observing the frequency counter, and confirm that 0.0 appears on the right side of the counter.  
Turn the FIX RIT VR to “+” and “-” and check that the frequency varies more than  $\pm$ 1.5 kHz. Set the control back to the original position.

## 2-4 VCO voltage adjustment

### 1. Instruments

- 1) Frequency counter
- 2) DC volt meter
- 3) RF VTVM

### 2. Adjusting procedure

- 1) Connect the frequency counter between terminal TP-1, PLL unit (X60-1120-00/11/61) and the GND terminal. Connect the voltmeter between terminal TP-3 and the GND terminal. (refer to Fig. 37)  
Connect an RF VTVM between terminal TP-1 and the GND terminal. After connecting, measure and adjust at the following points:
- 2) Frequency check

Band/VFO scale	0	250	500
WWV, JJY	18.83MHz	19.08MHz	19.33MHz
1.5MHz	10.33MHz	10.58MHz	10.83MHz
3.5MHz	12.33MHz	12.58MHz	12.83MHz
7.0MHz	15.83MHz	16.08MHz	16.33MHz
14.0MHz	22.83MHz	23.08MHz	23.33MHz
21.0MHz	29.83MHz	30.08MHz	30.33MHz
28.0MHz	36.83MHz	37.08MHz	37.33MHz
28.5MHz	37.33MHz	37.58MHz	37.83MHz
29.0MHz	37.83MHz	38.08MHz	38.33MHz
29.5MHz	38.33MHz	38.58MHz	38.83MHz

- 3) Disconnect the freq. counter. With the VFO set to 0 kHz, check that the RF VTVM indicates 0.6 V  $\pm$ 2 dB at each frequency band.
- 4) Set VFO scale to “0” and adjust VCO voltage listed below.

Band	Coil	VCO Voltage
1.5MHz, 3.5MHz	T4	2V
WWV BAND, 7MHz	T3	
14MHz, 21MHz	T2	1.8V
28 ~ 29.5MHz	T1	2V

## 2-5 Standard oscillator frequency adjustment

### 1. Instruments

- 1) Frequency counter

### 2. Adjusting procedure

- 1) Connect the frequency counter to TP-8 on the PLL ASS'Y unit, on the 1.5 MHz BAND, adjust frequency to 38.500000 MHz  $\pm$  10 Hz by TC-1. (refer to Fig. 37)

**NOTE:** When the frequency counter is connected to TP-8, the digital display may read intermittent and incorrectly. Use a high impedance probe (HP 1121A).

## 2-6 ANTENNA and MIX coil adjustment

### 1. Instrument

- 1) SSG (Standard Signal Generator)

### 2. Adjusting procedure

- 1) Since the resonant point may deviate due to a shift in antenna impedance, be sure the antenna is terminated at 50 ohms.  
Set the AGC SW to FAST.  
DRIVE: Centered (12 o'clock position)
- 2) Apply SSG output at 60 dB (500  $\mu$ V) to the antenna terminal and adjust the COILPACK unit (X44-1290-00) in the order listed for maximum AF output and sensitivity. Reduce the SSG output as sensitivity increases (refer to Fig. 38 Table 3).

Table 3

SSG OUTPUT	BAND	VFO SCALE	COILPACK
10.250MHz	WWV	250	L4 L11
1.900MHz	1.5MHz	400	L3 L10
3.750MHz	3.5MHz	250	L5 L12
7.150MHz	7.0MHz	150	L6 L13
14.175MHz	14.0MHz	175	L7 L14
21.225MHz	21.0MHz	225	L8 L15
28.880MHz	28.5MHz	300	L9 L16

**NOTE:** If the 1.5 MHz BAND is readjusted, then complete coilpack alignment must be repeated.

## 2-7 IFT adjustment

### 1. Instrument

- 1) SSG (Standard Signal Generator)

### 2. Adjusting procedure

- 1) Set AGC SW to FAST and the VFO dial scale to 400.
- 2) Apply a signal of 1.900 MHz at 40 dB to the antenna terminal.
- 3) Adjust T4 on the RF unit (X44-1280-00), L1, L9 to L13 on the IF unit (X48-1240-11) and L3, L10 on the COILPACK unit (X44-1290-00) for maximum S meter reading. After adjustment, turn the L9 core counterclockwise 180° from oscillation starting point. (refer to Fig. 38)

# ADJUSTMENTS

TOP VIEW

Fig. 37 TS-180 Top view

# ADJUSTMENTS

## BOTTOM VIEW

Fig. 38 TS-180 Bottom view

## ADJUSTMENTS

- 28.272 MHz, adjust VR-1 on the RF unit for minimum internal signal at 28.722 MHz.

### 2-8 IF trap coil adjustment

#### 1. Instruments

- SSG (Standard Signal Generator)
- AF VTVM
- AF Dummy load
- Oscilloscope

#### 2. Adjusting procedure

- BAND: WWV.

Make connections as shown in Fig. 39. Apply a signal of 10.02 MHz at 0 dB, and adjust receiving sensitivity to maximum.

While applying an 8.830 MHz signal at from 60 dB to 80 dB from the SSG, adjust L1 and L2 on the COILPACK unit (X44-1290-00), until the S-meter reading becomes minimum. When the S-meter does not deflect, make adjustments until the AF output becomes minimum.

Fig. 39 IF trap coil adjustment

### 2-9 S-meter adjustment

#### 1. Instrument

- SSG (Standard Signal Generator).

#### 2. Adjusting procedure

- After adjusting each section until sensitivity becomes maximum, set the AGC SW to FAST. Apply a signal at 14.175 MHz, -6 dB (0.25  $\mu$ V) to the antenna terminal. Adjust the AF GAIN control fully clockwise, and adjust L12 on the IF unit for a voltmeter reading of 2V/8 $\Omega$ .
- Apply a signal at 14.175 MHz, 6 dB (1  $\mu$ V) to the antenna terminal. Adjust VR2 on the IF unit (X48-1240-11) for an S-1 reading.
- Set the SSG output to 40 dB (50  $\mu$ V) and adjust VR3 on

the IF unit for an S-9 reading.

- Repeat steps 2 and 3 two or three times for optimum adjustment.

### 2-10 Noise blanker adjustment

#### 1. Instruments

- Noise generator with attenuator.

#### 2. Adjusting procedure

- Center the NB TUNE control, connect the noise generator to the antenna terminal and adjust the Drive control for maximum noise output, and set the Generator output for an S-meter reading within S5 to S7.
- Turn ON the NB switch and adjust L7 on the IF unit for null.

**NOTE:** Carefully adjust L7 so that the frequency will not vary excessively.

### 2-11 ATT (Attenuator) adjustment

#### 1. Instrument

- SSG (Standard Signal Generator)

#### 2. Adjusting procedure

- Set AGC SW to FAST, BAND SW to 14 MHz
- Apply a 14.175 MHz signal at 0 dB (0.5  $\mu$ V), and adjust receiving sensitivity for maximum. Set the SSG output for S-5 level, ATT SW ON. Set the SSG output to S-5 plus 20 dB and adjust VR-1 on the IF unit (X48-1240-11) until the S-meter reads S-9 + 20 dB.
- Shift the SSG output (14.175 MHz) by about 15 kHz and set the ATT SW to RGC. Check that the RGC indicator lights when the SSG output is between 67 and 87 dB.

## 3. Counter Adjustment

### 3-1 Input level adjustment

#### 1. Instruments

- RF VTVM

#### 2. Adjusting procedure

- With the BAND switch set to 14 MHz and the dial scale to 250 connect an RF VTVM between No. 5 pin of Q10 (SN74S00N) of the DISPLAY unit (X54-1430-00) and the GND. Adjust T1 in the unit for maximum deflection.

## 4. TX Adjustment

### 4-1 TX BPF adjustment

#### 1. Instruments

- Sweep Generator
- Oscilloscope
- Detector

#### 2. Adjusting procedure

- Remove the short jumper wire between TP2 and TP3 in the COILPACK unit (X44-1290-00). Connect the Slow Sweep Generator to the RF OUT terminal (TP3). Connect the Detector to the INH terminal on the COILPACK unit (X44-1290-00).

# ADJUSTMENTS

- 2) Place the STBY SW to SEND.  
Adjust L17 ~ L34 in the COILPACK unit for the output wave form as shown in Fig. 40.

Fig. 40-a

Make adjustments in the following sequence:  
1.5 MHz → 3.5 MHz → 7 MHz → 14 MHz → 21 MHz → 28 MHz

Table 4

Adjusting sequence	BAND	Marker point			Coil pack adjusting point
		A	B	C	
1	1.5 MHz	1.75	1.9	2.05	L17 L18 L19
2	3.5 MHz	3.4	3.75	4.1	L20 L21 L22
3	7.0 MHz	6.8	7.15	7.5	L23 L24 L25
4	14.0 MHz	13.65	14.175	14.1	L26 L27 L28
5	21.0 MHz	20.65	21.225	21.8	L29 L30 L31
6	28.0 MHz	27.6	28.8	30.1	L32 L33 L34

After adjustment, resolder terminals TP-2 and TP-3, making sure the pattern is not altered.

**Example:** In the adjustment of the 1.5 MHz band, turn L19 and 17 until the marker point is set to the band edge, then turn L18 so that the waveform is balanced over the entire length. Use the same procedure for all bands.

Fig. 40-b TX BPF adjustment

## 4-2 Base current adjustment

### 1. Instruments

- 1) RF Dummy load
- 2) DC Current meter

### 2. Adjusting procedure

- 1) Set VR-8, 6, 9, 10 and 13 on the IF unit full counterclockwise.  
Set VR-1 in the 10 W FINAL and 100 W FINAL unit full counterclockwise. Set VR1, 3 on the FILTER unit full counterclockwise, and VR2 at 9 o'clock. Connect the RF dummy load to the ANT terminal.

### 2) 10 W FINAL Adjustment

Remove the jumper, and connect the current meter between TP1 + and TP2 - in the FINAL unit. Place the STBY SW to SEND, and after 15 seconds, adjust VR1 on the FINAL unit for 100 mA. (refer to Fig. 37).

Disconnect the current meter between TP1 and TP2 in the 10W FINAL unit and resolder the terminals.

### 3) 100 W FINAL Adjustment.

- a) Connect the black wire in the FINAL unit to the harness black wire. Connect the current meter between TP1 + and TP2 - in the FINAL unit.

Place the STBY SW to SEND, and after 15 seconds, adjust VR1 on the FINAL unit for 200 mA Reading.

- b) Turn the meter switch to the VC position, and check that the meter reads 13.8 V.

- c) Turn the MODE switch to the CW position, and reduce the RF POWER so the external current meter reads 10A.

Turn the Meter switch to the Ic position, and adjust VR2 in the FINAL for an Ic meter reading of 10 A. (refer to Fig. 38)

## 4-3 RF Detector adjustment

### 1. Instrument

- 1) DC voltmeter

### 2. Adjusting procedure

- 1) Set the VFO to 400 on the 1.5 MHz BAND, and adjust the DRIVE until maximum TX output is obtained.
- 2) Connect the DC voltmeter to the No. 3 terminal of VR1 on the FILTER unit, and adjust TC1 until the voltmeter reads minimum.

## 4-4 ALC meter adjustment (Starting point)

### 1. Adjusting procedure

- 1) Setting  
RF PWR: FULL CLOCKWISE  
STBY SW: SEND
- 2) Turn the meter SW to ALC, and adjust VR4 on the IF unit for meter zero.

## 4-5 ALC adjustment

### 1. Instrument

- 1) RF dummy load

### 2. Adjusting procedure

- 1) Setting  
RF PWR: FULL CLOCKWISE, MODE SW: CW  
BAND: 14 MHz, VFO: "200"  
STBY SW: SEND  
Set VR9 to 12 o'clock.
- 2) Adjust the DRIVE control until maximum output is obtained.  
Adjust VR3 on the FILTER unit until the RF POWER meter reads 95 W.

# ADJUSTMENTS

## 4-6 ALC meter adjustment

### 1. Instrument

- 1) RF dummy load

### 2. Adjusting procedure

- 1) Setting  
RF PWR: FULL CLOCKWISE  
MODE SW: CW  
METER SW: ALC
- 2) Make adjustment until full power is obtained on all bands. Adjust each VR on the IF unit for an I<sub>c</sub> scale reading of 8A, but with the meter switch in the ALC position. On the 1.5 MHz, Adjust T<sub>1</sub> on the RF unit and L<sub>15</sub> on the IF unit until the ALC meter reads max. Make adjustments as listed below.

Table 5

BAND	VFO Scale	Adjusting VR
1.5 MHz	400	VR-8
3.5 MHz	250	VR-6
7.0 MHz	250	VR-13
14.0 MHz	250	VR-9
21.0 MHz	250	VR-10
29.0 MHz	250	VR-11

## 4-7 RF meter adjustment

### 1. Instrument

- 1) RF dummy load (50Ω)

### 2. Adjusting procedure

- 1) RF PWR setting: FULL CLOCKWISE, MODE SW: CW  
BAND: 14 MHz, Dial scale: "200"  
STBY SW to SEND
- 2) Adjust DRIVE until maximum output is obtained. Turn Meter SW to RF and adjust VR2 in the FILTER unit for an I<sub>c</sub> scale reading of 15 A.

## 4-8 Protection adjustment

### 1. Instrument

- 1) RF dummy load (50Ω)

### 2. Adjusting procedure

- 1) RF PWR: FULL CLOCKWISE, MODE SW: CW  
BAND: 14 MHz, Dial scale: 200, STBY SW: SEND
- 2) Adjust for maximum output into a 50Ω dummy load.
- 3) Adjust RF PWR for 24W. Disconnect the load (open ANT) and quickly adjust VR1 on the FILTER unit for PRO On threshold in transmit.
- 4) Short the ANT terminal and quickly verify protection in TX.

**NOTE:** This check is not required for the TS-180V. Protection circuit adjustment should be made after adjustment of detector balance (section 4-3), otherwise the circuit will not function properly.

## 4-9 Carrier suppression adjustment

### 1. Instruments

- 1) RF VTVM, RF dummy load

### 2) Directional coupler

Fig. 41 Carrier Suppression Adjustment

### 2. Adjusting procedure

- 1) Connect as shown in Fig. 41 and adjust at 14,200 MHz CW for full power.
- 2) Switch MODE to NORM and adjust VR16 and TC1 on the IF unit (X48-1240-11) alternately until the RF VTVM reads minimum. Make this adjustment so the NORM and REV levels are equal.

## 4-10 Carrier point adjustment

### 1. Instruments

- 1) AF Generator (AG)
- 2) AF, RF VTVM
- 3) Frequency counter
- 4) RF dummy load

### 2. Adjusting procedure (Fig. 42)

- 1) Connect the AG to the MIC terminal and apply an input of 1500 Hz at 2 mV.
- 2) Adjust DRIVE for maximum output.
- 3) Adjust MIC GAIN until the COMP meter reads 10 dB.
- 4) Shift the signal frequency between 300 Hz and 2700 Hz and adjust TC2 (in NORM) and TC3 (in REV) on the PREMIX unit for equal output reading between the high and low frequencies. (refer to Fig. 37)
- 5) After adjustment, check carrier suppression.
- 6) Connect the frequency counter to No. 26 connector on the IF unit (X48-1240-11).
- 7) MODE SW: CW, STBY SW: SEND  
Adjust VR7 on the PREMIX unit for 8830.700 KHz.

## 4-11 FSK adjustment

### 1. Instrument

- 1) Frequency counter

# ADJUSTMENTS

Fig. 42 Carrier point adjustment

Fig. 43 Side tone adjustment

## 2. Adjusting procedure

- 1) MODE SW: FSK  
Connect the frequency counter to the 3P terminal (No. 52) on the PREMIX unit (X50-1570-00) and adjust the VFO for 40250.00 kHz. (VFO 250)
- 2) RF PWR: FULL COUNTERCLOCKWISE, STBY SW: SEND.  
Adjust VR4 on the PREMIX unit for 40247.875 kHz  $\pm$  10 Hz. Then, install a blank plug into the FSK Jack and adjust VR3 on the PREMIX unit for 40247.705 kHz  $\pm$  10 Hz.

## 4-12 Side tone adjustment

### 1. Instruments

- 1) AF VTVM
- 2) Oscilloscope
- 3) AF dummy load
- 4) Key (Shorting lead also usable)

### 2. Adjusting procedure

- 1) MODE SW: CW, AF VR: 12 o'clock position  
Adjust VR15 on the IF unit (X48-1240-11) for AF output of 0.63V/8 $\Omega$  (50 mW) with the key down. (refer to Fig. 38)

## 5. PREMIX adjustment

### 5-1 40.25 MHz IFT adjustment

#### 1. Instrument

- 1) RF VTVM

#### 2. Adjusting procedure

Set the VFO to "250", and connect the RF VTVM to TP-4 on the PREMIX unit (X50-1570-00). Adjust T1 and T2 on the PREMIX unit for maximum.

### 5-2 49.08 MHz IFT adjustment

#### 1. Instrument

- 1) RF VTVM

## 2. Adjusting procedure

- 1) Set the VFO scale to "250". Connect the RF VTVM to TP-5 on the PREMIX unit (X50-1570-00). Adjust T3 and T4 on the PREMIX unit for maximum. (refer to Fig. 37)

## 6. PLL adjustment

### 6-1 BPF adjustment

#### 1. Instruments

- 1) Sweep Generator
- 2) Oscilloscope
- 3) Frequency counter
- 4) RF dummy load

#### 2. Adjusting procedure

- 1) Disconnect the No. 52 connector from the PREMIX unit (X50-1570-00).  
Connect the detector to TP-8 in the PLL unit (X50-1560-00) and connect the oscilloscope to its output. (refer to Fig. 44)

Table 7

BAND \ VFO SCALE	0	250	500
WWV, JJY	18.83 MHz	19.08 MHz	19.33 MHz
1.5 MHz	10.33 MHz	10.58 MHz	10.83 MHz
3.5 MHz	12.33 MHz	12.58 MHz	12.83 MHz
7.0 MHz	15.83 MHz	16.08 MHz	16.33 MHz
14.0 MHz	22.83 MHz	23.08 MHz	23.33 MHz
21.0 MHz	29.83 MHz	30.08 MHz	30.33 MHz
28.0 MHz	36.83 MHz	37.08 MHz	37.33 MHz
28.5 MHz	37.33 MHz	37.58 MHz	37.83 MHz
29.0 MHz	37.83 MHz	38.08 MHz	38.33 MHz
29.5 MHz	38.33 MHz	38.58 MHz	38.83 MHz

Connect the Sweep Generator output to TP-6 on the PLL unit. Output waveform should be as shown with Table 6.

# ADJUSTMENTS

Table 6

BAND	f1	Marker frequency f0	f2	Adjusting coil	Procedure
3.5 MHz	33.75 MHz	36.625 MHz	39.5 MHz	T23, T24, T25	Turn the core of each of the three coils repeatedly until the waveform shown below is obtained.
WWV	28.75 MHz	31.25 MHz	33.75 MHz	T20, T21, T22	
14 MHz	24.5 MHz	26.625 MHz	28.75 MHz	T17, T18, T19	
21 MHz	18.5 MHz	20.5 MHz	22.5 MHz	T14, T15, T16	
28 MHz	10.0 MHz	11.6 MHz	13.5 MHz	T8, T9, T10	

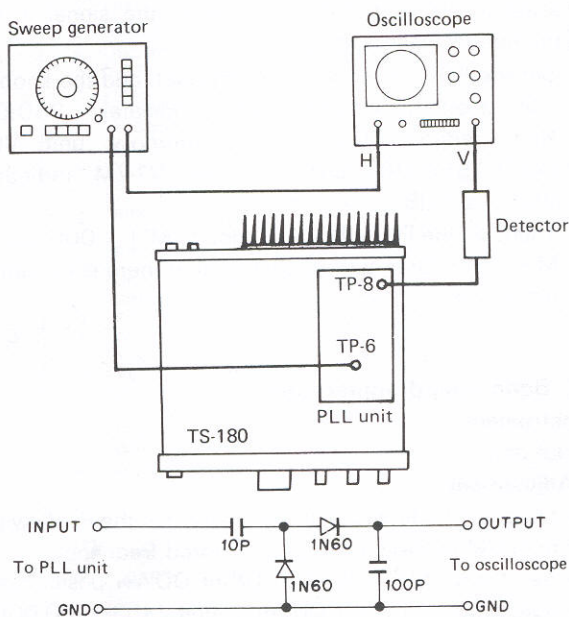

Fig. 44 PLL adjustment

- 2) Adjust as item 1, Connect the No. 52 connector on the PREMIX unit and connect the frequency counter to TP-1 in the PLL unit. Check that frequency reads as shown in Table 6.
- 3) After checking item 2, Table 7:
  - a) Remove the frequency counter from TP-1 in the PLL unit.
  - b) Connect the voltmeter to TP-1 in the PLL unit.
  - c) Set the VFO to "0" and verify the voltage for each band is  $0.6V \pm 2$  dB.

**NOTE:** If the sweep generator output impedance is far greater than 50 ohms, reduce it to 50 ohms by inserting a resistor or pad.

## 6-2 49.08 MHz tuning circuit adjustment

### 1. Instruments

- 1) RF VTVM

### 2. Adjusting procedure

- 1) Set the VFO to "250", connect the RF VTVM to TP-4 in the PLL unit ( $\times 50$ -1560-00).
- 2) Adjust T5 and T6 in the PLL unit for maximum.

## 6-3 MIXER balance adjustment

### 1. Instruments

- 1) Field strength meter or Spectrum analyzer

### 2. Adjusting procedure

- 1) Band: 28.5 MHz; Set the VFO to "250", Connect the spectrum analyzer to TP6 in the PLL unit (X50-1560-00).
- 2) Set the spectrum analyzer to 49.08 MHz (PREMIXER signal), and adjust VR-1 in the PLL unit for minimum. (refer to Fig. 37)

## 7. Memory adjustment

### 7-1 VCO adjustment

#### 7-1-1 1st VCO adjustment

##### 1. Instruments

- 1) Frequency counter
- 2) Digital voltmeter
- 3) High impedance probe.

**NOTE:** This adjustment can be disregarded if the frequency counter input impedance is sufficiently high and the input cable capacity is low.

##### 2. Adjusting procedure

- 1) Connect the frequency counter through a high impedance probe (HEWLETT PACKARD 1121) to TP4 in the VCO unit (X50-1550-00). Connect the digital voltmeter to TP5 in the VCO unit (X50-1550-00).
- 2) Turn the RCV switch to the FIX/M RECALL position, the FIX/M OUT SW to the "M1" or "M" position. Turn the Power SW ON, and check that the frequency reads 30.000 MHz. If the frequency is not 30.000 MHz, correct it by the M. SHIFT SW. Adjust L36 in the VCO unit (x50-1550-00) for a voltmeter  $8.6V \pm 0.02V$  reading.
- 3) After item 2 adjustment, touch the M. SHIFT switches

# ADJUSTMENTS

UP or DOWN and check that frequency reads 20.020 MHz, and the digital voltmeter reads approx. 1V.

## 7-1-2 2nd VCO adjustment

### 1. Instruments

- 1) RF VTVM
- 2) Digital voltmeter
- 3) Frequency counter
- 4) High impedance probe

Fig. 45 2nd VCO adjustment

### 2. Adjusting procedure

- 1) Connect the frequency counter and RF VTVM to the 2nd gate of Q11 3SK40 (M) in the VCO unit (X50-1550-00).
- 2) Turn the RCV switch to the VFO position, and check that the frequency reads 7.9700 MHz. Then, adjust L19, L21, L22 in the VCO unit (X50-1550-00) for maximum RF VTVM reading.
- 3) Connect the frequency counter to the MJ6 terminal in the VCO unit. Connect the digital voltmeter to TP1 in the VCO unit.

4) Turn the RCV switch to the FIX/M RECALL, the FIX/M OUT SW to M1 or "M", and set frequency to read 6.69000 MHz by the M. SHIFT SW (UP or DOWN). Adjust L10 in the VCO unit for a  $5.0\text{ V} \pm 0.02\text{ V}$  digital voltmeter reading.

5) Set frequency to read 6.000 MHz by the M. SHIFT UP (or DOWN) and check that the voltmeter reads approx. 1.5 V.

## 7-1-3 VCO Output level adjustment

### 1. Instrument

- 1) RF VTVM

### 2. Adjustment

1) Connect an RF VTVM between the TP-2 terminal on the Premix unit (X50-1570-00) and GND. Set the RCV switch to VFO. With the dial scale set to "250", store the signal in the memory at M.IN. Similarly, set the dial scale to "0" and "500" and store the signal in the memory at each setting.

2) Set the RCV switch to FIX/M RECALL and the knob to "M", then check that the display indicates 250.0. Next, adjust TC1 of the memory unit VCO (X50-1550-00) until the RF VTVM indicates  $90\text{ mV} \pm 1\text{ dB}$ .

Then, set the FIX/M RECALL knob to M' ( 000.0) and M ( 500.0) in turn to confirm that there is no output difference.

## 7-2 Scan speed adjustment

### 1. Instrument

Not required.

### 2. Adjustment

- 1) Store any frequency in the memory. Set the RCV switch to FIX/M RECALL to recall the stored frequency.
- 2) Set the M. SHIFT lever to UP or DOWN position, and adjust VR1 in the CONTROL unit (X53-1100-00) to obtain the desired speed.

**NOTE:** The FAST speed is not adjustable. The SLOW speed is factory adjusted to 1/10 of the FAST speed.

## SPECIFICATIONS

- Oscillator frequency** ..... 6.65 ~ 6.05 MHz
  - Oscillator circuit** ..... Clapp
  - Output voltage** ..... 0.3 V ± 1 dB (across 50-ohm load)
  - Frequency stability** ..... Within 100 Hz per 30 minutes after 3 minutes warm-up (at room temperature)
  - Solid-state complement** ..... FET: 2  
Transistor: 2  
Diode: 5
  - Power source** ..... From TS-180S
  - Dimensions** ..... 180(7-1/8)W x 133(5-1/4)H x 287(11-5/16)D mm(inch)
  - Weight** ..... 2.9 kg (6.4 lbs)
- \* Specifications are subject to change for improvement without notice.

# PS-30

## SPECIFICATIONS

### Power Supply Section

Input voltage	AC 120 V/220 V or 220 V/240 V $\pm 10\%$ , 50/60 Hz
Output voltage	DC 13.8 V (Standard voltage)
Output current	20 A (intermittent Load 50 % duty cycle)
Continuous load current	15 A max (inclusive of external output terminal)
Output voltage fluctuation	Within $\pm 0.7$ V at AC 120 V, 220 V, 240 V $\pm 10\%$ (Load current : 15 A) (No. load output voltage : less than 16 V at 120 V, 220 V, 240 V)

Ripple voltage	Less than 20 mV (rms), out- put current 15 A
Power consumption	Approx. 470 W at AC 120 V, 220 V, 240 V (Load current : 20 A)

### General Dimensions

180 (7''-1/16) W x 133  
(5''-1/4) H x 287  
(11''-5/16) D mm (inch)  
Approx. 8.9 Kg (19.6 lbs)

### Weight

Circuit design and ratings are  
subject to change for improve-  
ment without notice.

# AT-180/SCHEMATIC DIAGRAM/SPECIFICATIONS

AT-180

## SPECIFICATIONS

### ANTENNA COUPLER

**Frequency Range** ..... 6 amateur bands from 1.8 to 29.7 MHz

**Input Impedance** ..... 50Ω

**Output Impedance** ..... 50 to 500Ω, unbalanced

**Through Power** ..... 200W at max.

**Insertion Loss** ..... Less than 0.5 dB in matched state

**PL** ..... 1.8 MHz only

**Output Impedance** ..... 20 to 500Ω, unbalanced

**Through Power** ..... 100W at max.

### WATTMETER

**Type** ..... Through-line wattmeter

**Frequency Range** ..... 1.8 to 30 MHz

**Measurable RF Power** ..... Up to 20/200W, switched

**Kinds of RF Power** ..... Forward or reflected power, switched.

**Impedance** ..... 50Ω

**Accuracy** ..... Better than ± 10% of full scale

### SWR METER

**SWR Detection** ..... Toroid core direction coupler

**Measurable Range** ..... 1.1 to 10

**Min. Power Required** ..... 4W

### GENERAL

#### Connectors

**INPUT** ..... UHF type, 50Ω

**ANT-1** ..... UHF type

**ANT-2** ..... UHF type

**ANT-3** ..... Stud and wing nut

**GND** ..... Stud and wing nut

**Dimensions** ..... W 166 mm (6-17/32")  
 H 153 mm (6")  
 D 190 mm (7-1/2")

**Net Weight** ..... 2.8 kg (6.2 lbs.) approx.

## SWITCH MODULE (W02-0302-08)

Ref No	Parts No.	Description	Re- marks
VR1	R12-1024-05	Semi-fixed resistor 1kΩ (B)	
VR2	R12-4020-05	Semi-fixed resistor 50kΩ (B)	
VR3	R12-3420-08	Semi-fixed resistor 20kΩ (B)	
VR4	R05-3407-08	Potentiometer 50kΩ (B) CAL	
R3	RD14BB2E511J	Carbon resistor 510Ω ±5% 1/4W	
R4	RD14BB2E104J	Carbon resistor 100kΩ ±5% 1/4W	
	S36-2026-15	Paddle switch × 4	

## DETECTOR MODULE (W02-0303-08)

Ref No.	Parts No.	Description	Re- marks
C1.2	FM05ZC150J5	Mica capacitor 15pF 500V	
C3.4	CK45F1H104Z	Ceramic capacitor 0.1μF +80%, -20%	
R1.2	RD14BB2E510J	Carbon resistor 51Ω ±5% 1/4W	
D1.2	V11-7763-26	Diode 2-1k261 × 2	
L1.2	L39-0403-08	Detector coil	

## 1. INSTRUMENTS

### 1) Terminated Power Meter

- Frequency range: 50 MHz or more
- Input impedance: 50Ω
- Power range: 20W and 200W

### 2) HF Transmitter or Transceiver

- Output: 100W CW  
Variable to 10W.  
Example: TS-180, TS-820S

## 2. POWER METER ADJUSTMENT

### 1) Test Equipment Connection

Fig. 1

### 2) Adjustment

- Connect as in Fig. 1.
- Unless otherwise specified, controls should be set as follows:

ANT SW	DUMMY
BAND SW	14
200W/20W SW	200W
FWD/REF SW	FWD
POWER/SWR SW	POWER
CAL/SWR SW	SWR

Tune up the transceiver at 14.175 MHz.

- Adjust the transceiver for 100W output at the power meter (adjusted by the carrier level control).  
Adjust VR2 on the switch unit for a meter reading of 100 on the AT-180.

Fig. 2

- As in step 3, lower transceiver output to 10W and adjust VR3 for a meter indication of 10 on the 20W scale.

## 3. CALIBRATION OF REF POWER

### 1) Connection

As in Fig. 1.

### 2) Adjustment

- Set controls as described in 2.2.  
Confirm 100W CW output reading.
- Unkey the transceiver and reverse the coaxial cables between the INPUT and DUMMY terminals on the AT-180. Move the FWD/REF switch to the REF position.
- Transmit and adjust VR1 for previously confirmed 100W reading.
